### **Preface**

This book contains in a readily available form the data, charts and tables which are regularly required by heating, ventilating and air conditioning engineers in their daily work.

The data is presented in a concise manner to enable it to be applied directly in the actual daily work of the HVAC engineer. The book is designed for everyday use and a comprehensive bibliography has been included for the benefit of those who wish to pursue the theoretical side of any particular topic.

For this edition some errors have been corrected, the explanatory notes on the psychrometric chart have been improved and the chart in previous editions has been replaced, with permission, by the well known CIBSE chart. Additional data has been included on design temperatures and ventilation rates and information has been inserted on precautions against legionellosis in both hot water systems and air conditioning plant. The data on duct thicknesses and sizes has been revised to conform to current practice. A new section has been included on natural ventilation and the information on types of refrigeration compressors has been expanded. The data on refrigerants has been completely revised to list the new non-CFC and non-HCFC refrigerants. Practising engineers will still meet old plant which contains refrigerants which are now obsolete or obsolescent, and therefore the properties of the more important of these are also given.

The policy of previous editions of giving tabulated data in both SI and Imperial units has been continued although theoretical expressions are generally given only in SI units.

F. Porges

The author would like to acknowledge the help of Mrs Christine Tenby in the compilation of the index.

SMOKE NUMBER	0	1	2	3	4	5
LINES mm SPACES mm	ALL WHITE	1 9	2.3	3.7 6.3	5.5 4.5	ALL BLACK

#### THE RINGELMANN SCALE FOR GRADING DENSITY OF SMOKE

Observer should stand 30-300 m from stack and hold scale at arm's length. He should then determine the shade in the chart most nearly corresponding to the shade of the smoke. Care should be taken to avoid either bright sunlight or dark buildings in the background.

## Excess of air for good conditions

For anthracite and coke	40%
For semi-anthracite, hand firing	70-100%
For semi-anthracite, with stoker	40 - 70%
For semi-anthracite, with travelling grate	30-60%
For oil	10-20%
For gas	10%

### Theoretical values of combustion air and flue gases

Fuel	Theoretical air Volume at S.T.	for combustion P.	Theoretical flue Volume at S.T.	0 1
	m³/kg	ft³/lb	m³/kg	ft³/lb

#### Heat losses in a boiler

1 Sensible heat carried away by dry flue gases

$$egin{aligned} L_1 &= \mathit{WC}_{\mathrm{p}}(t_1 - t_{\mathrm{A}}) \ \mathrm{kJ} \ \mathrm{per} \ \mathrm{kg} \ \mathrm{of} \ \mathrm{fuel} \ &= \mathit{WC}_{\mathrm{p}}(t_1 - t_{\mathrm{A}}) rac{100}{S} \ \mathrm{per} \ \mathrm{cent} \end{aligned}$$

2 Heat lost by free moisture in fuel

$$L_2 = w(H-h) ext{ kJ per kg of fuel} \ = w(H-h) rac{100}{S} ext{ per cent}$$

3 Heat lost by incomplete combustion

$$L_3=24\,000rac{
m CO}{
m CO_2+CO}{
m C}$$
 kJ per kg of fuel $=24\,000rac{
m CO}{
m CO_2+CO}{
m C} imesrac{100}{S}$  per cent

4 Heat lost due to Carbon in Ash

$$L_4 = W_c imes 33\,950 ext{ kJ per kg of fuel} \ = W_c imes 33\,950 imes rac{100}{S} ext{ per cent}$$

5 Heat lost by Radiation and Unaccounted Losses obtained by difference

$$L_{\rm s} = S - (M + L_1 + L_2 + L_3 + L_4)$$

where

W = weight of combustion products, kg per kg fuel

 $W_{\rm c}$  = weight of carbon in ash, kg per kg fuel

w = weight of water in fuel, kg per kg fuel

 $C_{\rm p} = {
m specific heat capacity of flue gas, kg per kJ per deg C}$ 

= 1.0

 $t_1 = \text{temperature of flue gas }^{\circ}\text{C}$ 

t<sub>A</sub> = ambient temperature in boiler room, °C

S = higher calorific value of fuel, kJ per kg

H = total heat of superheated steam at temperature  $t_1$  and atmospheric pressure, kJ per kg

 $h = \text{sensible heat of water at temperature } t_A$ , kJ per kg

C = weight of carbon in fuel, kg per kg

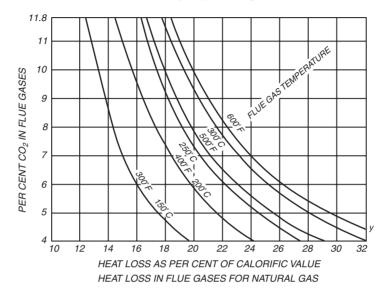

CO = percentage by volume of carbon monoxide in flue gas

 $CO_2$  = percentage by volume of carbon dioxide in flue gas

M = utilised heat in boiler output.

The largest loss is normally the sensible heat in the flue gases. In good practice it is about 20%.

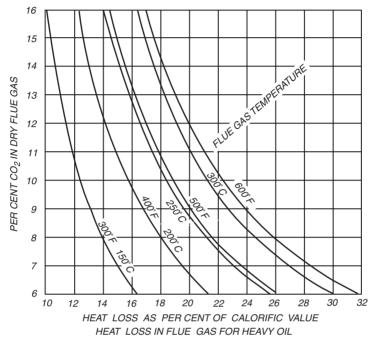

## Sensible heat carried away by flue gases

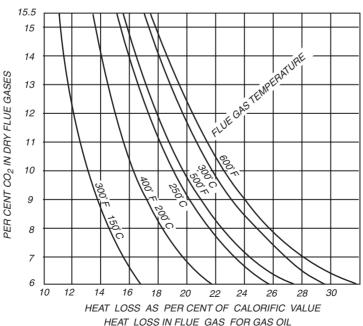

HEAT LOSS IN FLUE GASES FOR TOWN GAS

## Sensible heat carried away by flue gases

## Chimney sizes

Theoretical chimney draught

$$h = 354 H \left(\frac{1}{T_1} - \frac{1}{T_2}\right)$$

where

h = draught in mm water

H = chimney height in m

 $T_1$  = absolute temperature outside chimney K

 $T_2$  = absolute temperature inside chimney K

$$h = 7.64 H \left( \frac{1}{T_1} - \frac{1}{T_2} \right)$$

where

h = draught in inches of water

H = chimney height in ft

 $T_1$  = absolute temperature outside chimney  ${}^{\circ}R$ 

 $T_2$  = absolute temperature inside chimney  $^{\circ}$ R.

#### Chimney area

The chimney should be designed to give a maximum velocity of 2 m/s (7 ft/s) for small furnaces, and 10-15 m/s for large furnaces.

$$A = \frac{Q}{V}$$

where

A = cross-sectional area of chimney, m<sup>2</sup>

Q = volume of flue gases at chimney temperature, m<sup>3</sup>/s

 $\dot{V} = \text{velocity, m/s}$ 

An empirical rule is to provide 400 mm<sup>2</sup> chimney area per 1 kW boiler rating (0.2 in<sup>2</sup> per 1000 Btu/hour boiler rating).

#### Recommended sizes of explosion doors or draught stabilisers for oil firing installations

Cross-sectional area of chimney in <sup>2</sup>	Release opening of stabiliser, approx., in	Cross-sectional area of chimney m <sup>2</sup>	Release opening of stabiliser, approx., mm
40-80	6×9	0.025-0.050	150×230
80-200	$8 \times 13$	0.050 - 0.125	$200{ imes}330$
200-300	$13 \times 18$	0.125 - 0.200	$330{ imes}450$
300-600	$16{ imes}24$	0.200 - 0.400	$400 { imes} 600$
600-1500	$24{ imes}32$	0.400 - 1.000	$600 \times 800$

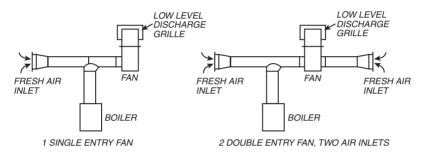

#### Combustion air

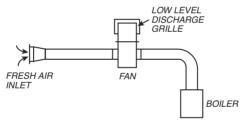

A boiler house must have openings to fresh air to allow combustion air to enter. An empirical rule is to allow 1600 mm<sup>2</sup> free area per 1 kW boiler rating (1.5 in<sup>2</sup> per 2000 Btu/hour boiler rating).

#### Flue dilution

Flue gases from gas burning appliances can be diluted with fresh air to enable the products of combustion to be discharged at low level or near windows.

#### Typical arrangements

3 DOUBLE ENTRY FAN. SINGLE AIR INLET

To reduce CO2 concentration to 1%, fan must handle 100 m3 mixed volume per 1 m<sup>3</sup> natural gas fuel burnt.

In determining fan pressure allowance must be made for pressure due to local wind conditions.

Discharge grille must have free area not less than that of flue.

Fresh air intake must have free area not less than that of flue.

Fresh air intake should be on same face of building as discharge grille in order to balance out wind effect.

## Density and specific volume of stored fuels

	Density		Specific volume			
Fuel Wood Charcoal, hard wood Charcoal, soft wood	$kg/m^3$	lb/ft³	m³ per 1000 kg	ft <sup>3</sup> per ton

## **Classification of Coal**

Based on volatile matter and coking power of clean material

Class	Volatile matter percent (dry mineral matter free basis)	General description	
101 102	< 6.1 6.1-9.0	Anthracites	
201 202 203	9.1-13.5 13.6-15.0 15.1-17.0	Dry steam coals  Coking steam coals	Low volatile
204 206	17.1–19.5 9.1–19.5	Heat altered low volatile steam coals	steam coals
301 305 306	19.6-32.0 19.6-32.0 19.6-32.0	Prime coking coals Mainly heat altered coals	Medium volatile
401 402	32.1-36.0 >36.0	Very strongly coking coals	
501 502	32.1-36.0 > 36.0	Strongly coking coals	
601 602	32.1-36.0 > 36.0	Medium coking coals	High volatile
701 702	32.1-36.0 > 36.0	Weakly coking coals	coals
801 802	32.1-36.0 > 36.0	Very weakly coking coals	
901 902	32.1-36.0 > 36.0	Non-coking coals	

#### Flow of oil in pipes

Head loss of various viscosities for laminar flow

Viscosity at temp. in pipe cS	4.0	25	45	250	500
$\overline{i_1}$	$0.54 \times 10^{-4} \frac{f_1}{d_1^4}$	$3.4 \times 10^{-4} \frac{f_1}{d_1^4}$	$6.1 \times 10^{-4} \frac{f_1}{d_1^4}$	$34 \times 10^{-4} \frac{f_1}{d_1^4}$	$67 \times 10^{-4} \frac{f_1}{d_1^4}$
$\dot{i}_2$	$1.7 \times 10^4 \frac{f_2}{d_2^4}$	$11 \times 10^4 \frac{f_2}{d_2^4}$	$20 \times 10^4 \frac{f_2}{d_2^4}$	$110{\times}10^4 \frac{f_2}{d_2^4}$	$220{\times}10^4 \frac{f_2}{d_2^4}$

 $i_1 = i_2 = \text{head loss}$  in feet of oil per foot of pipe or metres of oil per metre of pipe. (Length of pipe to include allowances for bends, valves and fittings)

 $f_1 = \text{flow of oil in gal/hr}$ 

 $f_2 = \text{flow of oil in litre/s}$ 

 $d_1$  = internal diameter of pipe in inches

 $d_2$  = internal diameter of pipe in mm.

The above formulae are for laminar flow. Flow is laminar if Reynolds Number (Re) is less than 1500. Reynolds number can be checked from the following formulae. As Re is a dimensionless ratio it is the same in all consistent systems of units. The coefficients in the following formulae take into account the dimensions of  $f_1$ ,  $d_1$ ,  $f_2$ ,  $d_2$  respectively.

The viscosity to be taken is that at the temperature of the oil in the pipe.

Viscosity at temp. in pipe cS	4.0	25	45	250	500
	$16\frac{f_1}{d_1}$	$2.5\frac{f_1}{d_1}$	$1.0\frac{f_1}{d_1}$	$0.25\frac{f_1}{d_1}$	$0.12\frac{f_1}{d_1}$
Re	$32\times10^4\frac{f_2}{d_2}$	$4.5 \times 10^4 \frac{f_2}{d_2}$	$2.8 \times 10^4 \frac{f_2}{d_2}$	$0.45{ imes}10^4rac{f_2}{d_2}$	$0.25 \times 10^4 \frac{f_2}{d_2}$

## Heat and thermal properties of materials

## Expansion by heat

Linear expansion is the increase in length

$$L_2 = L_1(1+et)$$

Surface expansion is the increase in area

$$A_2 = A_1(1+2et)$$

Volumetric expansion is the increase in volume

$$V_2 = V_1(1+3et)$$

where

t =temperature difference (K)

 $L_1 = \text{original length (m)}$ 

 $A_1 = \text{original area (m}^2)$ 

 $V_1 = \text{original volume (m}^3)$ 

 $L_2 = \text{final length (m)}$ 

 $A_2 = \text{final area (m}^2)$ 

 $V_2 = \text{final volume (m}^3)$ 

e = coefficient of linear expansion (m/mK)

## Sensible heat for heating or cooling

$$H = cM(t_2 - t_1)$$

where

H = Heat(J)

M = mass (kg)

c = specific heat capacity (J/kg K)

 $t_1 = \text{initial temperature (°C)}$ 

 $t_2 = \text{final temperature (°C)}$ 

## **Expansion of gases**

General gas law

$$PV = mRT$$

$$R = (C_{\rm D} - C_{\rm v})$$

#### where

 $P = \text{pressure (absolute)}, \text{ N/m}^2 \text{ (lbf/ft}^2)$ 

 $V = \text{volume, m}^3 \text{ (ft}^3)$ 

m = mass, kg (lbm)

R = gas constant, J/kg K (ft lbf/lbm K)

T = absolute temperature,  $^{\circ}$ K ( $^{\circ}$ R)

 $C_{\rm p}\!=\!{\rm specific}$  heat capacity at constant pressure, J/kg K (Btu/lb°F)

 $C_{\rm v} = {\rm specific\ heat\ capacity\ at\ constant\ volume,\ J/kg\ K\ (Btu/lb°F)}$ 

#### For air

R = 287 J/kg K

=96 ft lbf/lbm K

=53.3 ft lbf/lbm  $^{\circ}$ F

G = MR = universal gas constant which is the same for all gases

#### where

G = universal gas constant J/kg K

M = molecular weight of gas (dimensionless)

R = gas constant for the gas J/kg K

$$G = (Cp_m - Cv_m)$$

#### where

 $Cp_{\rm m}=$  specific heat capacity at constant pressure in J/kg mol K  $Cv_{\rm m}=$  specific heat capacity at constant volume in J/kg mol K

$$PV_{\rm m} = nGT$$

#### where

 $V_{\rm m}\!=\!{
m volume}$  of n moles

n = number of moles

#### In various units

G = 1.985 Btu/lb  $^{\circ}$ F

= 1544 ft lbf/lbm  $^{\circ}$ F

=2780 ft lbf/lbm K

=1.985 kcal/kg K

= 8.314 kJ/kg K

At N.T.P. 1 kg mol occupies 22.4 m<sup>3</sup> 1 lb mol occupies 359 ft<sup>3</sup>

At S.T.P. 1 kg mol occupies 23.7 m<sup>3</sup>

1 lb mol occupies 379 ft<sup>3</sup>

### Methods of heating and expanding gases (not vapours)

Type of expansion	Remarks	Work done W	Change of internal energy E	Heat absorbed H	Final temperature
Constant pressure	Isobar	$P(V_2-V_1)$	$MC_{\rm v}~(T_2-T_1)$	$MC_{ m p}(T_2-T_1)$	$T_1igg(rac{V_2}{V_1}igg)$
Constant temperature	Isotherm	$P_1 V_1 \log_{\mathrm{e}} rac{V_2}{V_1}$	0	$P_1 V_1 \log_{\mathrm{e}} \frac{V_2}{V_1}$	$T_1$
Constant heat	$ \begin{array}{c} \textbf{Adiabatic} \\ PV^{\gamma} = \textbf{const.} \end{array} $	$\frac{P_1V_1-P_2V_2}{\gamma-1}$	$MC_{\rm v}(T_2-T_1)$	0	$T_1 igg(rac{V_1}{V_2}igg)^{\gamma-1}$
Int. energy & temperature change	Polytrope $PV^n = \text{const.}$	$\frac{P_1V_1 - P_2V_2}{n-1}$	$MC_{\rm v}(T_2-T_1)$	W+E	$T_1 igg(rac{V_1}{V_2}igg)^{n-1}$

#### where

W = external work done by gas (kJ)

E = increase of internal energy by gas (kJ)

H = total heat absorbed (kJ)

 $P_1$ ,  $P_2$  = initial, final, pressure (N/m<sup>2</sup>)

 $V_1$ ,  $V_2$  = initial, final, volume (m<sup>3</sup>)

 $T_1$ ,  $T_2$  = initial, final, temperature (°C)

M = mass (kg)

 $\gamma = C_{\rm p}/C_{\rm v}$  (dimensionless)

n = index of expansion law (dimensionless)

 $C_{\rm v} = {\rm specific\ heat\ capacity\ at\ constant\ volume\ (kJ/kg\ K)}$ 

 $C_p$  = specific heat capacity of constant pressure (kJ/kg K)

#### Mixtures of gases

$$PV=mR_mT$$
 
$$m=m_1+m_2+m_3$$
 
$$R_{\rm m}=\frac{R_1m_1+R_2m_2+R_3m_3}{m_1+m_2+m_3}={\rm gas~constant~of~mixture}$$

## The laws of perfect gases

The Critical Temperature of a substance is that temperature above which it cannot exist as a liquid.

The Critical Pressure is the pressure of a saturated vapour at its critical temperature.

#### Critical temperatures and pressures of various substances

	Critical temperatu	re	Critical pressure absolute		Boiling temperature at atmospheric pressure	
Substance	${}^{\circ}F$	$^{\circ}C$	lb./sq. in.	atm.	${}^{\circ}F$	$^{\circ}C$
Air	-220	-140	573	39	_	_
Alcohol (C <sub>2</sub> H <sub>6</sub> O)	421	216	956	65	172.4	78
Ammonia (NH <sub>3</sub> )	266	130	1691	115	-27.4	-33
Benzol (C <sub>6</sub> H <sub>6</sub> )	554	292	735	50	176	80
Carbon-dioxide (CO <sub>2</sub> )	88.2	31	1132	77	-110	-79
Carbon-monoxide (CO)	-222	-141	528	35.9	-310	-190

(From Mark's Mech. Eng. Hand.)

## Estimations of temperatures of incandescent bodies

Colours of different temperatures

Faint red	$960^{\circ}\mathrm{F}$	$516^{\circ}\mathrm{C}$
Dull red	$1290^{\circ}\mathrm{F}$	$700^{\circ}\mathrm{C}$
Brilliant red	$1470^{\circ}\mathrm{F}$	$750^{\circ}\mathrm{C}$
Cherry red	$1650^{\circ}\mathrm{F}$	$900^{\circ}\mathrm{C}$
Bright cherry red	$1830^{\circ}\mathrm{F}$	$1000^{\circ}\mathrm{C}$
Orange	$2010^{\circ}\mathrm{F}$	$1100^{\circ}\mathrm{C}$
Bright orange	$2190^{\circ}\mathrm{F}$	$1200^{\circ}\mathrm{C}$
White heat	$2370^{\circ}\mathrm{F}$	$1300^{\circ}\mathrm{C}$
Bright white heat	$2550^{\circ}\mathrm{F}$	$1400^{\circ}\mathrm{C}$
Brilliant white heat	$2750^{\circ}\mathrm{F}$	$1500^{\circ}\mathrm{C}$

#### Heat transfer

#### Transfer of heat may occur by

- 1 Conduction
- 2 Convection
- 3 Radiation
- 1 Conduction is the transfer of heat through the molecules of a substance.
  - (a) Internal Conduction is transmission within a body.
  - (b) External Conduction is transmission from one body to another, when the two bodies are in contact.

**Thermal Conductivity** is the heat flowing through one unit of area and one unit of thickness in one unit of time per degree temperature difference.

Thermal Conductance is the heat flowing through a structural component of unit area in unit time per degree temperature difference between its faces.

$$H = \frac{AK(t_2 - t_1)}{X} = AC(t_2 - t_1)$$
 
$$C = \frac{K}{X}$$

where

H = heat flow, W (Btu/hr)

 $A = \text{area. m}^2 \text{ (ft}^2$ )

 $K = \text{thermal conductivity, W/mK (Btu in/hr ft}^2 \,^{\circ}\text{F})$ 

C = thermal conductance, W/m<sup>2</sup> K (Btu/hr ft<sup>2</sup> °F)

X = thickness, m (in)

 $t_1$  = temperature at cooler section, °C (°F)  $t_2$  = temperature at hotter section, °C (°F)

Thermal Resistance is the reciprocal of thermal conductance

$$H = rac{A(t_2-t_1)}{R} \qquad ext{W (Btu/hr)} \ R = rac{1}{C} = rac{X}{K} \qquad rac{m^2 \, K}{W} \; rac{ ext{hr ft}^2 \, ^\circ ext{F}}{ ext{Btu}}$$

Convection is the transfer of heat by flow of currents within a fluid body. (Liquid or gas flowing over the surface of a hotter or cooler body.)

$$H=aA\left(t_{2}-t_{1}
ight)=rac{A(t_{2}-t_{1})}{R_{1}}(\mathrm{Btu/hr}\ \mathrm{or}\ \mathrm{watts})$$

a = Thermal conductance (Btu/hr sq ft  $^{\circ}$ F or W/m $^{2}$   $^{\circ}$ C)

$$R_1 = \frac{1}{aX}$$
 = Thermal resistance.

The amount of heat transferred per unit of time is affected by the velocity of moving medium, the area and form of surface and the temperature difference.

3 Radiation is the transfer of heat from one body to another by wave motion.

Stephan-Boltzmann Formula

$$E = C \bigg(\frac{T}{100}\bigg)^4 \quad \begin{array}{ll} E = \text{Heat emission of a body (Btu/hr or Watts)} \\ T = \text{Absolute temperature (°R or °K)} \\ C = \text{Radiation constant} \end{array}$$

Quantities of heat transferred between two surfaces:

$$Q_{\mathrm{Rad}} = CA \left[ \left( rac{T_1}{100} 
ight)^4 - \left( rac{T_2}{100} 
ight)^4 
ight]$$

A = Area

 $T_1T_2$  = Absolute temperatures of hot and cold surfaces respectively.

For the absolute black body

$$C = 5.72$$
 Watts per sq m per  $(\text{deg C})^4$   
= 0.173 Btu per hr per sq ft per  $(\text{deg F})^4$ 

For other materials see table below.

	W	Btu		W	Btu
	$\overline{m^2}$	$\overline{hrft^2}$		$\frac{m^2}{m^2}$	$\frac{-m}{hr ft^2}$
	(°C)4	$(^{\circ}F)^4$		(°C)4	$(^{\circ}F)^4$

## Conduction of heat through pipes or partitions

#### **Symbols**

 $t_{\rm m}\!=\!{\rm Logarithmic}$  mean temperature difference

 $t_{a1}$  = Initial temperature of heating medium

 $t_{a2}$  = Final temperature of heating medium

 $\overline{t_1}$  = Initial temperature of heated fluid

 $t_2$  = Final temperature of heated fluid.

The heat exchange can be classified as follows:

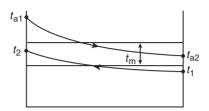

1 Parallel Flow, the fluids flow in the same directions over the separating wall.

$$t_{\mathrm{m}} = \frac{t_{\mathrm{a}1} - t_{\mathrm{a}2} + t_2 - t_1}{\log_{\mathrm{e}} \frac{(t_{\mathrm{a}1} - t_1)}{(t_{\mathrm{a}2} - t_2)}} = \frac{\mathrm{Initial\ temp.\ dif.} - \mathrm{Final\ temp.\ dif.}}{2.3 \log_{10} \frac{\mathrm{Initial\ temp.\ dif.}}{\mathrm{Final\ temp.\ dif.}}}$$

#### 52

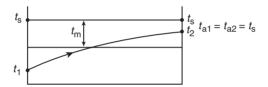

#### **2** Counter Flow, the directions are opposite.

$$t_{
m m} = {
m (as~before)} = rac{{
m Initial~temp.~dif.} - {
m Final~temp.~dif.}}{2.3 \log_{10} rac{{
m Initial~temp.~dif.}}{{
m Final~temp.~dif.}}}$$

#### 3 Evaporators or Condensers

One fluid remains at a constant temperature while changing its state.

$$t_{
m m} = ({
m as \ before}) = rac{(t_1 - t_2)}{2.3 \, \log_{10} rac{t_{
m s} - t_2}{t_{
m s} - t_1}}$$

#### 4 Mixed Flow

One of the fluids takes an irregular direction with respect to the other.

$$t_{
m m} = rac{t_{
m a1} - t_{
m a2}}{2} - rac{t_1 - t_2}{2}$$

#### Heat transfer in the unsteady state

**Newton's Law of cooling.** In the warming and cooling of bodies, the heat gain or loss, respectively, is proportional to the difference between the temperatures of the body and the surroundings.

#### Let:

 $\theta_{\rm s} =$  Temperature of the surroundings  $^{\circ}{\rm C}$ 

 $\theta_1$  = Initial temperature of the body  $^{\circ}$ C

 $\theta_2$  = Temperature of the body  $^{\circ}$ C

k = Thermal conductivity of the body W/mK

 $w = \text{Density of the body kg/m}^3$ 

s =Specific heat capacity of the body J/kgK

h = Coefficient of heat transfer between the body and the surroundings  $W/m^2K$ 

r = Radius of a sphere or cylinder, or half thickness of a slab cooled or heated on both faces or thickness of a slab cooled or heated on one face only

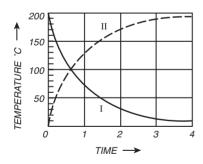

t =Cooling (or heating) time secs.

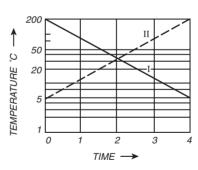

Then

$$\frac{\theta_1 - \theta_{\rm s}}{\theta_2 - \theta_{\rm s}} = {\rm e}^{-Kt} \quad \text{and} \quad \log_{\rm e}(\theta_2 - \theta_{\rm s}) - \log_{\rm e}(\theta_1 - \theta_{\rm s}) = -Kt$$

where K = Constant which can be found by measuring the temperatures of the body at different times  $t_1$  and  $t_2$  and which is given by

$$K = \frac{\log_{\mathrm{e}}(\theta_2 - \theta_{\mathrm{s}})}{\log_{\mathrm{e}}(\theta_1 - \theta_{\mathrm{s}})} \bigg/ (t_2 - t_1)$$

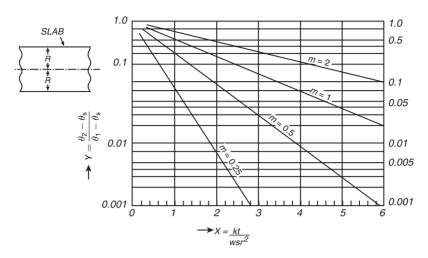

Cooling curve (I) and heating curve (II) showing relation of temperature and time on linear and semi-logarithmic paper.

Graphs showing how the temperature of cooling or heating up bodies can be plotted on semi-logarithmic paper by introducing the following dimensionless ratios

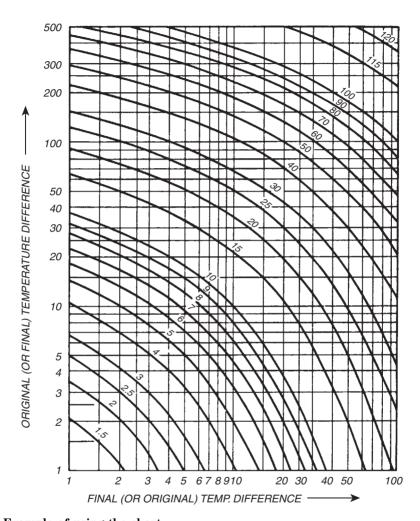

$$Y = \frac{\theta_2 - \theta_s}{\theta_1 - \theta_c}$$
  $x = \frac{kt}{wsR^2}$   $m = \frac{k}{hr}$ 

The Increased Heat Requirement of Buildings during the heating up period causes a greater heat requirement than the steady state. This additional heat loss depends mainly on the type of building, length of heating interruption and heating up time, and type of heating installation. The allowance for covering the increased heat loss during heating up is usually expressed as a percentage of the heat loss in the steady state. See pages 91 and 92.

The temperatures during warming up of bodies are represented graphically by curves which are symmetrical to cooling down curves.

#### Logarithmic mean temperature differences

#### Example of using the chart

Water to water calorifier with counter flow Primary flow temperature  $80^{\circ}$  C. Secondary return temperature  $10^{\circ}$  C Primary return temperature  $70^{\circ}$  C. Secondary flow temperature  $40^{\circ}$  C Original temperature difference  $=80-70=10^{\circ}$  C Final temperature difference  $=70-40=30^{\circ}$  C From chart: Log mean temp. dif.  $=18^{\circ}$  C The chart can be used equally well for  $^{\circ}$  C or  $^{\circ}$  F.

#### Transmission of heat

#### Heat transmission coefficients for metals

			Watts	Btu
			$\overline{m^2 \circ C}$	$\overline{\mathit{ft}^2 \mathit{hr}{}^\circ \mathit{F}}$
Water	Cast iron	Air or Gas	8.0	1.4
Water	Mild steel	Air or Gas	11.0	2.0
Water	Copper	Air or Gas	11.0	2.25
Water	Cast iron	Water	220 to 280	40 to 50
Water	Mild steel	Water	340 to 400	50 to 70
Water	Copper	Water	350 to 450	62 to 80
Air	Cast iron	Air	6.0	1.0
Air	Mild steel	Air	8.0	1.4
Steam	Cast iron	Air	11.0	2.0
Steam	Mild steel	Air	11.0	2.5
Steam	Copper	Air	17.0	3.0
Steam	Cast iron	Water	900	160
Steam	Mild steel	Water	1050	185
Steam	Copper	Water	1170	205

The above values are average coefficients for practically still fluids. The coefficients are dependent on velocities of heating and heated media - on type of heating surface, temperature difference, and other circumstances. For special cases, see literature and manufacturer's data.

Table of  $n^{1.3}$  for radiator and pipe coefficients in relation to various temperature differences

## Heat loss of copper pipes

For various temperature differences between pipe and air

Nominal bore			s for temper e (W/m)	rature	Heat loss for temperature difference (Btu/hr ft)			
in	mm	$40^{\circ}C$	$55^{\circ}C$	$72^{\circ}C$	$70^{\circ}F$	$100^{\circ}F$	130°F	
$\frac{1}{2}$	15	21	32	45	22	34	47	
$\frac{1}{2}$ $\frac{3}{4}$	22	28	43	60	29	45	53	
1	28	34	53	76	36	56	79	
$1\frac{1}{4}$	35	41	64	89	43	67	93	
$\lfloor \frac{1}{2} \rfloor$	42	47	74	104	49	77	108	
2	54	59	93	131	62	97	136	
$2\frac{1}{2}$	67	71	111	156	74	116	162	
3	76	83	129	181	87	135	189	
4	108	107	165	232	111	172	241	

## Heat loss of insulated copper pipes

For temperature difference 55°C (100°F)

For 25 mm thick insulation with k = 0.043 W/m°C (0.3 Btu in/ft<sup>2</sup> hr °F)

Nominal bore		$Heat\ loss$			
in	mm	W/m	Btu/hr ft		
$\frac{3}{4}$	22	8	8		
1	28	10	10		
$1\frac{1}{2}$	42	11.5	12		

Nominal bore		$Heat\ loss$			
in	mm	W/m	Btu/hr ft		
2	54	14.5	15		
$2\frac{1}{2}$	67	16	17		
3 -	76	19	20		

## Heat loss through lagging

Insulating material	Heat loss through 75 mm thickness per 55 K difference between faces $W/m^2$
Asbestos	75
Cork	32
Sawdust	54

Loss for bare metal for 55 K difference is approximately  $485~\text{W/m}^2$

# Properties of steam and air

# Properties of steam and other vapours

A vapour is any substance in the gaseous state which does not even approximately follow the general gas laws.

Highly superheated vapours are gases, if the superheat is sufficiently great, and they then approximately follow the general gas law.

#### Conditions of vapours

- 1 Dry Saturated vapour is free from unvaporised liquid particles.
- 2 Wet Saturated vapour carries liquid globules in suspension.
- **3 Superheated vapour** is vapour the temperature of which is higher than that of the boiling point corresponding to the pressure.

**Dryness fraction or quality of saturated vapour** (X) is the percentage of dry vapour present in the given amount of the wet saturated vapour.

$$X = rac{W_{
m s}}{W_{
m s} + W_{
m w}} imes 100\%$$

 $W_{\rm s}=$  Weight of dry steam in steam considered

 $W_{\rm w} =$ Weight of water in steam

The heat of the liquid 'h' is the heat in Joules per kg required to raise the temperature of the liquid from  $0^{\circ}C$  to the temperature at which the liquid begins to boil at the given pressure.

$$h = ct$$

c =Mean specific heat capacity of water

t = Temperature of formation of steam at pressure considered  $^{\circ}$ C

The latent heat of evaporation 'L' is the heat required to change a liquid at a given temperature and pressure into a vapour at the same temperature and pressure. It is divided into two parts

- 1 External latent heat of vapour = External work heat
- 2 Internal latent heat of vapour = Heat due to change of state

The total heat of a vapour (or enthalpy) is the amount of heat which must be supplied to 1 kg of the liquid which is at 0°C to convert it at constant pressure into vapour at the temperature and pressure considered.

#### Total heat of dry saturated vapour

$$H = h + L$$
 (Joules per kg)

h = Heat of liquid at the temperature of the wet vapour, Joules per kg

L = Latent heat, Joules per kg

#### Total heat of wet saturated vapour

$$H_{\rm w} = h + xL$$
 (Joules per kg)

x =Dryness factor

#### Total heat of superheated vapour

$$H_{\rm s} = h + L + c(t_{\rm s} - t)$$
 (Joules per kg)

 $c\!=\!$  Mean specific heat capacity of superheated vapour at the pressure and degree of superheat considered

 $t_{\rm s} =$  Temperature of superheat  $^{\circ}$ C

 $t_1 =$  Temperature of formation of steam  $^{\circ}$ C

#### Specific volumes of wet vapour

$$V_{
m w}=(1-x)V+xV_{
m D}$$
 
$$V_{
m w}=xV_{
m D},\quad x=rac{V_{
m w}}{V_{
m D}},\quad {
m when}\ x={
m very\ small}$$

 $V_{\rm w}\!=\!{
m Specific}$  volume of the wet vapour,  ${
m m}^3$  per kg

 $V_{\rm D} =$  Specific volume of dry saturated vapour of the same pressure, m<sup>3</sup> per kg (Can be found from the Vapour Tables).

#### Specific volume of superheated vapour

Approximate method by using Charles' Law

$$V = rac{V_{
m s} T_{
m s}}{T_{
m 1}}$$

### **Entropy of steam**

#### 1 Entropy of water

Change of Entropy =  $\log_e (T_1/T)$ 

 $T_1$ , T = Absolute temperature.

Entropy of water above freezing point =  $\phi_{\rm w} = \log_{\rm e} \left( T_1 / 273 \right)$ 

#### 2 Entropy of evaporation

Change of Entropy during evaporation = dL/TEntropy of 1 kg of wet steam above freezing point

$$\phi_{\rm s} = \phi_{\rm w} + \frac{xL_1}{T_1}$$

#### 3 Entropy of superheated steam

Change of entropy per kg of steam during superheating=  $C_{\rm p} \log_{\rm e}(T/T_1)$ 

Total entropy of 1 kg of superheated steam above freezing point

$$= \phi_{\mathrm{w}} + \frac{L_1}{T_1} + C_{\mathrm{p}} \log_{\mathrm{e}} \frac{T_{\mathrm{s}}}{T_1}$$

 $L_1 = \text{Latent heat of evaporation at } T_1^{\circ}\text{C} \text{ absolute}$ 

 $T_1 =$  Absolute temperature of evaporation

 $T_{\rm s} =$  Absolute temperature of superheat

### Temperature – entropy diagram for steam

Shows the relationship between Pressure, Temperature, Dryness Fraction and Entropy.

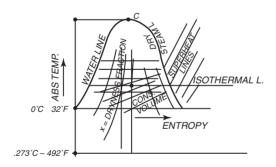

When two of these factors are given the two others can be found on the chart.

The ordinates represent the Absolute Temperature and the Entropy.

The chart consists of the following lines:

- 1 Isothermal lines
- 2 Pressure lines
- 3 Lines of dryness fraction
- 4 Water line between water and steam
- 5 Dry steam lines
- 6 Constant volume lines

The total heat is given by the area, enclosed by absolute zero base water line and horizontal and vertical line from the respective points.

An adiabatic expansion is a vertical line (expansion at constant entropy, no transfer of heat).

C=Critical temperature of steam

 $=706^{\circ} \text{F} \text{ to } 716^{\circ} \text{F}$ 

 $=375^{\circ}$ C to  $380^{\circ}$ C

Critical pressure:  $3200 \text{ lb/in}^2 = 217.8 \text{ atm} = 23,500 \text{ kN/m}^2$ 

### Mollier or total heat - entropy chart

Contains the same lines as the temperature-entropy diagram, but with ordinates representing the total heat and entropy of steam. This diagram is used to find the drop in the total heat of steam during an adiabatic expansion.

# Properties of air

### Symbols

V	volume of air-vapour mixture	$m^3$
m	mass of air-vapour mixture	kg
$p_{\mathrm{a}}$	partial pressure of dry air	$N/m^2$
$p_{ m wa}$	actual partial pressure of water vapour	$N/m^2$
$p_{ m ws}$	saturation pressure of water vapour	$N/m^2$
$p_{ m t}$	total pressure of mixture	$N/m^2$
t	dry bulb temperature	$^{\circ}\mathrm{C}$
T	absolute dry bulb temperature = $273+t$	K
$\phi$	relative humidity	per cent
X	specific humidity of air-vapour mixture	g/kg
$X_{\mathrm{s}}$	specific humidity of saturated air	g/kg
$\rho_{\rm a}$	density of dry air	$kg/m^3$
$\rho_{ m w}$	density of water vapour	$kg/m^3$
$\rho$	density of air-vapour mixture	$kg/m^3$
$\dot{R}$	gas constant	J/kg K
	=286 for air	
	= 455 for water vapour	

Atmospheric air is a mixture of dry air and water vapour. It can be treated as an ideal gas without great discrepancies and the gas laws can be applied to it.

General Gas Law	pV = mRT
	$\rho = \frac{m}{V} = \frac{p}{RT}$
Density of Dry Air	$ ho_{\mathrm{a}}=0.00350rac{p_{\mathrm{a}}}{T}$
Density of Water Vapour	$ ho_{\mathrm{w}} = 0.00220 rac{p_{\mathrm{w}}}{T}$
Density of Air-Water Vapour Mixture	$\rho = 0.00350  \frac{p_t}{T} - 0.00133  \frac{p_{\rm ws} \phi}{100T}$

Air-water vapour mixture is always lighter than dry air.

**Humidity** is the term applied to the quantity of water vapour present in the air.

**Absolute Humidity** is the actual mass of water vapour present, expressed in grams water vapour per kilogram mixture.

Specific Humidity is the actual mass of water vapour present, expressed in grams water vapour per kilogram dry air.

$$X = \frac{622\phi \rho_{\rm ws}}{(\rho - \rho_{\rm ws})100} \text{ g/kg}$$

#### Specific Humidity of Saturated Air

$$X_{
m s} = rac{622
ho_{
m ws}}{
ho - 
ho_{
m ws}} \ {
m g/kg}$$

#### Relative Humidity is

ratio of actual partial pressure of water vapour to vapour pressure at saturation at actual dry bulb temperature.

ratio of actual vapour density to vapour density at saturation at oractual dry bulb temperature.

ratio of actual mass of water vapour in given air volume to mass of orwater vapour required to saturate this volume.

It is usually expressed in %

$$\phi = \frac{p_{\text{wa}}}{p_{\text{ws}}} \times 100 = \frac{\rho_{\text{w}}}{\rho_{\text{ws}}} \times 100 = \frac{X}{X_{\text{s}}} \times 100\%$$

Saturated Air holds the maximum mass of water vapour at the given temperature. Any lowering of the air temperature will cause condensation of water vapour.

Dry Bulb Temperature is the air temperature as indicated by a thermometer which is not affected by the moisture of the air.

Wet Bulb Temperature is the temperature of adiabatic saturation. It is the temperature indicated by a moistened thermometer bulb exposed to a current of air.

**Dew Point Temperature** is the temperature to which air with a given moisture content must be cooled to produce saturation of the air and the commencement of condensation of the vapour in the air.

#### Specific Enthalpy of dry air

$$H = 1.01t \, \mathrm{kJ/kg}$$

Specific Enthalpy of air-water vapour mixture is composed of the sensible heat of the air and the latent heat of vaporisation of the water vapour present in the air and the sensible heat of the vapour.

$$H = 1.01t + X(2463 + 1.88t) \, \text{kJ/kg}$$

1.01 is the specific heat capacity of dry air.

2463 is the latent heat of vaporisation of water at 0°C.

1.88 is the specific heat capacity of water vapour at constant pressure.

#### Thermal expansion of air

Dry air expands or contracts uniformly 1/886 of its volume per °C under constant pressure.

#### **Humidity Chart for Air (Psychrometric Chart)**

See Chart No. 5. The chart shows the relationship between

- 1 Dry bulb temperature.
- 2 Wet bulb temperature.
- 3 Dew point.
- 4 Relative humidity.
- 5 Moisture content.
- 6 Specific volume.
- Specific enthalpy.

When any two of these are given the other five can be read from the chart. The chart contains the following lines

- (i) Lines of constant temperature.
- (ii) Lines of constant specific enthalpy.
- (iii) Lines of constant wet bulb temperature.
- (iv) Lines of constant relative humidity.
- (v) Lines of constant dewpoint, which are also lines of constant moisture content.
- (vi) Lines of constant specific volume.

#### Specific Heat Capacity of dry air

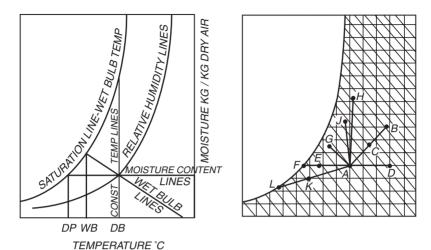

$$s = 1.01 \,\mathrm{kJ/kg}\,\mathrm{K}$$

 $=1.23\,\mathrm{kJ/m}^3\,\mathrm{K}$  at standard density

#### Viscosity of air

$$= 0.018 \times 10^{-3} \, Ns/m^2$$

#### Air condition

LINES OF CONSTANT ENTHALPY ARE NOT QUITE PARALLEL TO WET BULB LINES DP DEW POINT WB WET BULB TEMPERATURE DB DRY BULB TEMPERATURE

Change of condition of air	Indicated in sketch above	Remarks
Mixing of air volume $V_{\rm A}$ at condition A	A-C	$\frac{\text{Distance AC}}{\text{Distance BC}} = \frac{\text{Volume } V_{\text{B}}}{\text{Volume} V_{\text{A}}}$
with air volume $V_{\rm B}$ at condition B	В-С	Distance BC Volume V <sub>A</sub>
Heating	A-D	
Cooling	A-E-F	Dewpoint at F
Humidification with water injection	A-G	Slope depends on temperature of water but is approximately equal to slope of wet bulb line
Humidification with steam injection	А-Н	Temperature increases slightly but for practical purposes can be assumed to be constant
Constant temperature	A-J	
Cooling with	A-K	Coil dewpoint L
dehumidification		$\label{eq:contact_factor} \begin{aligned} \text{Coil contact factor} = & \frac{DB_A - DB_k}{DB_A - DB_L} \end{aligned}$

#### Man and air

(a) Respiration. An adult at rest breathes 16 respirations per minute, about 0.5 m<sup>3</sup>/hr (about 17.5 ft<sup>3</sup>hr). When working the rate is 3 to 6 times more.

Average composition of exhaled air

16.5% Oxygen Carbon dioxide 4.0% Nitrogen and argon 79.5%

Quantity of carbon dioxide exhaled in 24 hrs is about 1 kg (2.2 lb).

(b) Equilibrium of Heat. Heat is generated within the human body by combustion of food. Heat is lost from the human body by

Conduction and convection about 25% Radiation about 43% Evaporation of moisture about 30% Exhaled air about 2%

Evaporation prevails at high ambient temperatures. Conduction and convection prevail at low ambient temperatures.

Heat is liberated at a rate such that the internal body temperature is maintained at 37°C (98.6 °F).

# Proportion of sensible and latent heat dissipated by man at fairly hard work

Dry bulb temp	$^{\circ}\mathrm{C}$ $^{\circ}\mathrm{F}$	13 55	15 60	18 65	21 70	24 75	27 80	30 85	32 90
Sensible heat	%	75	68	60	51	42	31	20	10
Latent heat	%	25	32	40	49	58	69	80	90

(c) Heat Loss of Human Body. The total heat loss of an adult (sensible and latent) is approximately 117 W at room temperatures between 18°C and 30°C (about 400 Btu/hr).

- (i) Equivalent temperature combines the effects of air temperature, radiation and air movement. Numerically it is the temperature of a uniform enclosure in which a sizeable black body maintained at 24°C in still air would lose heat at the same rate as in the environment under consideration. It is measured by a Eupatheoscope.
- (ii) Effective temperature is an arbitrary index on the basis of subjective assessments of the degree of comfort felt by people in various environments. It takes into account air temperature, air movement and humidity. Numerically it is the temperature of still, saturated air which would produce an identical degree of comfort.
- (iii) Globe temperature combines the effects of air temperature, radiation and air movement. Numerically it is the reading of a thermometer with its bulb at the centre of a blackened globe 150 mm dia. It is similar to the equivalent temperature but easier to measure.
- (iv) Dry resultant temperature is similar to globe temperature but the globe used is 100 mm dia. This makes it rather less sensitive to radiation.
- (v) Environmental temperature combines air temperature and radiation. Numerically it is given by the formula

$$t_{\rm ei} = \frac{2}{3}t_{\rm r} + \frac{1}{3}t_{\rm a}$$

where  $t_{\rm ei} =$  environmental temperature,  $^{\circ}$ C

 $t_{\rm r} =$  mean radiant temperature of surroundings, °C

 $t_{\rm a} = {\rm air} \ {\rm temperature}, \ {\rm ^{\circ}C}$ 

It is not very different from the other scales when air velocity is low and air and radiant temperatures are not widely different, and is easier to use in calculations.

### Atmospheric data. Composition of air

Dry air is a mechanical mixtures of gases.

	Dry air per o	cent	Atmospheric at sea level	
	By volume	By weight	By volume	
Oxygen	21.00	23.2	20.75	
Nitrogen	78.03	75.5	77.08	
Carbon dioxide	0.03	0.046	0.03	
Hydrogen	0.01	0.007	0.01	
Rare gases	0.93	1.247	0.93	
Water vapour	_	_	1.20	

The composition of air is unchanged to a height of approximately  $10\,000$  metres. The average air temperature diminishes at the rate of about  $0.6^{\circ}\mathrm{C}$  for each 100 m of vertical height.

### Altitude-density tables for air

Altitude m	Barometer mm Hg	$_{m}^{Altitude}$	Barometer mm Hg	$_{m}^{Altitude}$	Barometer mm Hg

1,000	28.80	4,000	25.58	8,000	22.04
1,500	28.31	,		,	

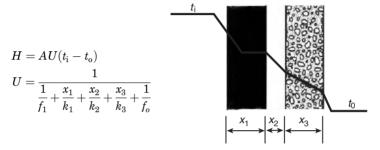

Normal Temperature and Pressure (NTP) is  $0^{\circ}C$  and  $101.325~kN/m^2.$  Standard Temperature and Pressure (STP) used for determination of fan capacities is  $20^{\circ}C$  and  $101.6~kN/m^2$  or  $60^{\circ}F$  and 30 in Hg. (These two sets of conditions do no convert directly, but the density of dry air is  $1.22~kg/m^3 = 0.0764~lb/ft^3$  at both conditions.)

### Heat losses

Heat input has to balance heat loss by

- 1 conduction and convection through walls, windows, etc.
- 2 infiltration of cold air.

### 1 Heat loss through walls, windows, doors, ceilings, floors, etc.

where

H = heat transmitted (W)

A =area of exposed surface (m<sup>2</sup>)

U = overall coefficient of heat transmission (W/m<sup>2</sup> K)

 $t_i = \text{inside air temperature (°C)}$ 

 $t_{\rm o} = {\rm outside}$  air temperature (°C)

x =thickness of material (m)

k = thermal conductivity of material (W/m K)  $f_i = \text{surface conductance for inside wall (W/m}^2 \text{ K)}$   $f_o = \text{surface conductance for outside wall (W/m}^2 \text{ K)}$ 

 $C = \frac{k}{r} = \text{conductance} = \text{heat flow through unit area in unit time (W/m}^2 \text{ K)}$ 

 $R = \frac{x}{b} = \frac{1}{C}$  = thermal resistivity

### Heat loss by infiltration

$$H = sdnV(t_i - t_o)$$

where

H = heat loss (kW)

s = specific heat capacity of air (kJ/kg K)

 $d = \text{density of air (kg/m}^3)$ 

n = number of air changes (1/s)

 $V = \text{volume of room (m}^3)$ 

 $t_1 = \text{inside air temperature (°C)}$ 

 $t_0$  = outside air temperature (°C)

#### Safety additions to heat loss calculations

1 For aspect

North East, 10%.

West, 5%

- For exposure 5%-10% for surfaces exposed to wind
- For intermittent heating

Buildings heated during day only. 10-15%

Buildings not in use daily, 25-30%

Buildings with long periods between use (e.g. churches), up to 50%

4 For height

Height of room m 5 10 11 12 and more 7.5 Addition 2.5 10 12.5 15 175

Air movement. Air movement makes any conditions of temperature and humidity feel colder; it lowers the effective temperature. An air velocity of 0.12 m/s may be considered as practically still air. A slight air movement is desirable for comfort to remove layers of humid and warm air from the surface of the human body. A higher air velocity is required in air at high temperature and high relative humidity than in air at low temperature and low relative humidity.

Entering air temperature in plenum heating systems must not be too much above or below the room temperature.

For heating

air entering temperature 26-32°C normally with good mixing air entering temperature 38-49°C

For cooling

inlets near occupied zones 5-9°C below room temperature high velocity jets, diffusion nozzles 17°C below room temperature

#### Allowance for warming up

(a) rooms heated daily (not at night)

$$H = \frac{0.063(n-1)H_{\mathrm{o}}}{Z}\,\mathrm{W}$$

(b) rooms not heated daily

$$H = \frac{0.1(Z+8)H_t}{Z}$$
W

where

H = heat required for warming up (W)

 $H_{\rm o} = {\rm heat~loss~through~outside~surface~(W)}$ 

 $H_{\rm t} = \text{total heat loss (W)}$ 

n = interruption of heating (hr)

Z = warming up time (hr)

#### Air temperatures at various levels

Increase of temperature from 1.5 m to 6 m is at the rate of 7% of temperature at 1.5 m per m. No further increase after 6 m.

$$t' = t + 0.07(h - 1.5)t$$

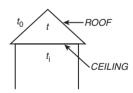

t' = temperature at given level above floor (°C)

t =temperature of 1.5 m above floor (°C)

h = height of given level above floor (m)

### Temperature of unheated spaces

$$t = rac{t_{\mathrm{i}}A_{\mathrm{c}}U_{\mathrm{c}} + t_{\mathrm{o}}A_{\mathrm{r}}U_{\mathrm{r}}}{A_{\mathrm{c}}U_{\mathrm{c}} + A_{\mathrm{r}}U_{\mathrm{r}}}$$

where

t =temperature of unheated space (°C)

 $t_i$  = temperature of adjacent room (°C)

 $t_0$  = outside temperature (°C)

 $A_c$  = area of surface between space and adjacent room - ceiling (m<sup>2</sup>)

 $A_{\rm r}$  = area of surface between space and outside - roof (m<sup>2</sup>)

 $U_{\rm c}\!=\!{
m coefficient}$  of heat transmission between space and adjacent room (W/m $^2$  K)

 $U_{\rm r}\!=\!{\rm coefficient}$  of heat transmission between space and outside (W/m $^2$  K)

### Combined coefficient for ceiling and roof

$$U_{
m E} = rac{U_{
m R} U_{
m c}}{U_{
m R} + rac{U_{
m c}}{r}}$$

where

 $U_{\rm E}\!=\!{
m combined}$  coefficient of heat transmission from inside to outside, based on ceiling area (W/m $^2$  K)

 $U_{\rm R} = {
m coefficient}$  of heat transmission of roof (W/m $^2$  K)  $U_{\rm c} = {
m coefficient}$  of heat transmission of ceiling (W/m $^2$  K)  $r = {
m ratio}$  of roof area to ceiling area (dimensionless)

Typical Air Infiltration Rates 10–27  $\rm m^3/hr$  per  $\rm m^2$  of facade at 50  $\rm N/m^2$  pressure difference between inside and outside

# Heat loss calculations for high buildings

Floor	Addition to infiltration rate	Designation of U-valve
Ground, 1st	nil	Normal
2nd to 4th	25%	Normal
5th to 11th	50%	Normal
Above 11th	100%	Severe

### Infiltration heat loss

Heat loss for 1 air change per hour =  $0.34 \text{ W/m}^3 \text{ K}$  (0.018 Btu/hr ft<sup>3</sup> °F).

#### Heat loss calculation

#### Contract temperatures and their equivalents

Inside temperatures obtained with a certain system with outside temperatures other than for which the system is designed. (Empirical formula by J. Roger Preston.)

$$t_4 = \left(t_1^{12} - t_2^{12} + t_3^{12}\right)^{1/12}$$

where

 $t_1 = \text{Contract inside temperature (K)}$ 

 $t_2 =$ Contract outside temperature (K)

 $t_3 = \text{Existing outside temperature (K)}$ 

 $t_4$  = Estimated inside temperature (K)

(Formula remains unchanged if all temperatures are in °F absolute.)

#### Table for 30°F contract outside and 60°F contract inside

Existing

# Condensation on glass windows

The chart gives the maximum permissible heat transfer coefficient of the glass necessary to prevent condensation at various indoor and outdoor temperatures and humidity.

#### Example

Inside temp.  $15^{\circ}$ C Inside rel. humidity 30% Outside temps.  $-5^{\circ}$ C

From chart, maximum permissible thermal transmittance coefficient is  $7.0 \text{ W/m}^2 \text{ K}$ .

# Fuel consumption

#### Direct method

$$F = \frac{Hn(t_{\rm i} - t_{\rm a})100}{EC(t_{\rm i} - t_{\rm o})}$$

where

F = fuel consumption during time n (kg)

 $H = \text{heat loss for temperature difference } (t_i - t_o) \text{ (kW)}$ 

n = time over which fuel consumption is required (s)

E = efficiency of utilisation of fuel (%)

C = calorific value of fuel (kJ/kg)

 $t_i = \text{inside temperature } (^{\circ}\text{C})$ 

 $t_a$  = average outside temperature during period considered (°C)

 $t_0$  = outside design temperature (°C)

$$E = E_1 E_2 E_3 E_4$$

where

$E_1 = \text{boiler efficiency}$	(60-75%)
$E_2$ = efficiency of pipework (loss of heat from pipes)	(80-90%)
$E_3 = $ efficiency of heaters	(90-100%)
$E_4$ = efficiency of control (loss due to over heating)	(80-95%)
E = efficiency of utilisation of fuel	(35-65%)

#### Degree day method

Degree days give the extent and length of time that the outdoor temperature is below 15.5°C.

number of degree days in a stated period = number of days  $\times$  (15.5°C-average outdoor temperature°C)

$$F = rac{hD100}{EC}$$
 
$$h = rac{24 imes 3600 imes H}{(15.5 - t_o)}$$

where

F = fuel consumption over period considered (kg)

h = heat loss per degree day (kJ/degree day)

E = efficiency of utilisation of fuel, as above (%)

C = calorific value of fuel (kJ/kg)

H = heat loss for design conditions (kW)

 $t_{\rm o} = {\rm outside\ design\ temperature\ (^{\circ}C)}$ 

D = actual number of degree days in period considered (number)

# Degree days for United Kingdom

Base temperature 15.5°C

# Cooling loads

Cooling load for air conditioning consists of:

conduction and convection through walls, windows, etc.

absorption of solar radiation on walls, windows, etc.

heat emission of occupants.

infiltration of warm outdoor air.

heat emission of lights and other electrical or mechanical appliances.

# 1 Heat gain through walls, windows, doors, etc.

$$H = AU(t_0 - t_i)$$

where

H = Heat gained (W)

 $A = \text{area of exposed surface (m}^2)$ 

U = coefficient of heat transmission (W/m<sup>2</sup> K)

 $t_{\rm o} = {\rm outside}$  air temperature (°C)  $T_{\rm i} = {\rm indoor}$  air temperature (°C)

Coefficients of heat transmission are the same as for heat losses in winter.

#### 2 Solar radiation

$$H = AF\alpha I$$

where

H = heat gained (W)

A =area of exposed surface (m<sup>2</sup>)

F = radiation factor

= proportion of absorbed radiation which is transmitted to interior

 $\alpha =$  absorption coefficients

= proportion of incident radiation which is absorbed

J = intensity of solar radiation striking the surface (W/m<sup>2</sup>)

# 3 Heat emission of occupants

Heat and moisture given off by human body; tabulated data.

#### 4 Heat gain by infiltration

$$H = nVd(h_0 - h_i)$$

where

H = heat gain (kW)

n = number of air changes (s<sup>-1</sup>)

 $V = \text{volume of room (m}^3)$ 

 $d = \text{density of air (kg/m}^3)$ 

 $h_{\rm o}\!=\!{\rm enthalpy}$  of outdoor air with water vapour (kJ/kg)

 $h_i$  = enthalpy of indoor air with water vapour (kJ/kg)

# 5 Heat emission of appliances

All power consumed is assumed to be dissipated as heat.

heat emission in kW = appliance input rating in kW

Lighting  $10-14 \text{ W/m}^2$ 

Small power, including IT equipment 10-25 W/m<sup>2</sup>

# Design summer indoor conditions

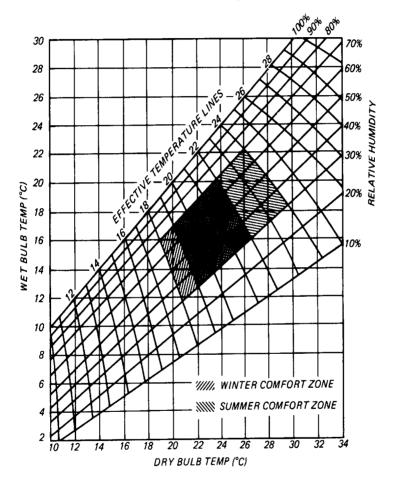

Optimum temperature 20°C to 22°C Optimum relative humidity 40% to 65%

# Desirable indoor conditions in summer for exposures less than 3 hours

0-4-11-	Inside air conditions with dewpoint constant at $14^{\circ} C$							
Outside dry bulb temp.	Dry bulb	Wet bulb	Relative humidity					
$^{\circ}C$	$^{\circ}C$	$^{\circ}C$	%					
	27	18.5	44					
32	26	18.0	46					
29	25	17.8	52					
27	24	17.5	51					
24	23	17.2	57					
21	22	17.0	57					

#### Relation of effective temperature, to dry and wet bulb temperatures and humidity, with summer and winter comfort zones

Charts for velocities up to 0.1m/s i.e. practically still air. For an air velocity of 0.4m/s the effective temperature decreases by 1°C.

#### Radiation factor (F)

Proportion of radiation absorbed by wall transmitted to interior.

U-value of wall		U-value of wall	
$\overline{W/m^2 K}$	F	$\overline{W/m^2 K}$	F
0.15	0.006	2.5	0.10
0.25	0.01	3.0	0.12
0.5	0.02	3.5	0.14
1.0	0.04	4.0	0.16
1.5	0.06	4.5	0.18
2.0	0.08	5.0	0.20

For glass, proportion of incident radiation transmitted plus proportion absorbed and transmitted = 0.84

For translucent Filon sheeting, proportion of incident radiation transmitted plus proportion absorbed and transmitted =0.72 for natural sheet or 0.43 for white tint sheet

#### Absorption coefficient ( $\alpha$ )

Proportion of radiation falling on wall absorbed by it.

Type of surface	$\alpha$
Very light surface, white stone, light cement	0.4
Medium dark surface, unpainted wood, brown stone, brick, red tile	0.7
Very dark surface, slate roofing, very dark paints	0.9

# Time lag in transmission of solar radiation through walls

Type of wall	Time lag hours
150 mm concrete	3
100 mm lightweight blocks	$2\frac{1}{2}$
560 mm brick	10
75 mm concrete with 25 mm thermal insulation board	2
50 mm timber	$1\frac{1}{2}$

# Transmission of radiation through shaded windows

Type of shading	Proportion transmitted				
Canvas awning, plain	0.28				
Canvas awning, aluminium bands	0.22				
Inside shade, fully drawn	0.45				
Inside shade, half drawn	0.68				
Inside Venetian blind, slats at 45°, aluminium	0.58				
Outside Venetian blind, slats at $45^{\circ}$ , aluminium	0.22

# 8

# Heating systems

# Hot water heating

Hot water carries heat through pipes from the boiler to room or space heaters.

#### Classification by pressure

Туре	Abbreviation	$Flow\ temp.$ $^{\circ}C$	Temp. $drop$ $^{\circ}C$
Low pressure hot water heating	LPHW		
(a) pumped circulation		50-90	10-15
(b) gravity circulation		90	20
Medium pressure hot water	MPHW	90-120	15-35
High pressure hot water	MPHW	120-200	27–85

# Classification by pipe system

One-pipe or two-pipe system Up-feed or down-feed system  $\}$  See typical schemes on page 120.

# Design procedure for hot water heating system

- 1 Heat losses of rooms to be heated.
- 2 Boiler output.
- 3 Selection of room heating units.
- 4 Type, size and duty of circulating pump.
- 5 Pipe scheme and pipe sizes.
- 6 Type and size of expansion tank.

#### 1 Heat losses

Calculated with data in section 6.

#### 2 Boiler

$$B = H(1+X)$$

where

B = boiler rating (kW)

H = total heat loss of plant (kW)

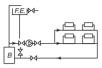

X = margin for heating up (0.10 to 0.15)

Boilers with correct rating to be selected from manufacturers' catalogues.

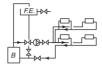

#### HOT WATER PIPE SYSTEMS

#### 1 PUMPED SYSTEMS

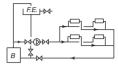

(a) OPEN EXPANSION TANK

(i) ONE-PIPE SYSTEM

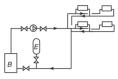

(ii) TWO-PIPE SYSTEM

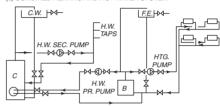

(iii) REVERSE RETURN TOTAL LENGTH OF FLOW IS THE SAME THROUGH ALL RADIATORS

(b) CLOSED EXPANSION TANK

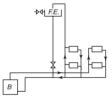

TWO-PIPE SYSTEM TAKEN AS EXAMPLE OTHER SYSTEMS ALSO POSSIBLE WITH EXPANSION TANK IN SAME RELATIVE POSITION

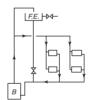

#### (c) COMBINED HEATING AND HOT WATER SYSTEM

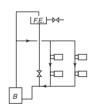

#### 2 GRAVITY SYTEMS

(i) TWO-PIPE UPFEED SYSTEM

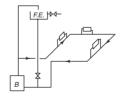

(ii) TWO-PIPE DROP SYSTEM

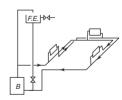

(iii) ONE-PIPE DROP SYSTEM

(iv) TWO-PIPE DROP SYTEM WITH BOILER (v) ONE-PIPE RING MAIN SYSTEM AND RADIATORS AT SAME LEVEL

(vi) TWO-PIPE REVERSE RETURN RING MAIN SYSTEM

F.E. FEED & EXPANSION TANK

| C.W. | COLD WATER TANK

HOT WATER CALORIFIER

PUMP

EXPANSION VESSEL BOILER

#### Room heaters 3

$$R = H(1+X)$$

where

R = rating of heaters in room (W)

H = heat loss of room (W)

X = margin for heating up (0.10 to 0.15)

Heaters with correct rating to be selected from manufacturers' catalogues.

#### Pump size

$$Q = \frac{H}{(h_1 - h_2)d}$$

where

 $Q = \text{volume of water (m}^3/\text{s)}$ 

H = total heat loss of plant (kW)

 $h_1 = \text{enthalpy of flow water (kJ/kg)}$ 

 $h_2$  = enthalpy of return water (kJ/kg)

 $d = \text{density of water at pump (kg/m}^3)$ 

For LPHW this reduces to

$$Q = \frac{H}{4.185(t_1 - t_2)}$$

where

 $t_1 = \text{flow temperature (°C)}$ 

 $t_2$  = return temperature (°C)

Pump head is chosen to give reasonable pipe sizes according to extent of system.

For LPHW 10 to 60 kN/m<sup>2</sup> with pipe friction resistance 80 to 250 N/m<sup>2</sup> per m run.

For HPHW 60 to 250 kN/m<sup>2</sup> with pipe friction resistance 100 to 300 N/m<sup>2</sup> per m run.

Gravity systems

$$p = hg(\varrho_2 - \varrho_1)$$

where

 $p = \text{circulating pressure available (N/m}^2)$ 

h = height between centre of boiler and centre of radiator (m)

 $\varrho_1 = \text{density of water at flow temperature (kg/m}^3)$ 

 $\rho_2 = \text{density of water at return temperature (kg/m}^3)$ 

g = acceleration of gravity = 9.81 (m/s<sup>2</sup>)

#### 5 Pipe sizes

$$p_{\mathrm{T}}=p_{1}+p_{2}$$
  $p_{1}=il$   $p_{2}=\sum Frac{V^{2}}{2}$ 

alternatively,

$$p_2 = \sum l_{
m E}$$

where

 $p_{\rm T}$  = total pressure loss in system (N/m<sup>2</sup>)

 $p_1$  = pressure loss in pipes due to friction (N/m<sup>2</sup>)

 $p_2 = \text{pressure loss in fittings (N/m}^2)$ 

i = pipe friction resistance per length (N/m<sup>2</sup> per m run)

l = length of pipe (m)

F = coefficient of resistance

V = velocity of water (m/s)

 $\rho = \text{density of water (kg/m}^3)$ 

 $l_{\rm E}$  = equivalent length of fitting (m)

i can be obtained from Chart 1.

Typical values of  $p_2/p_1$ 

Heating installations in buildings 0.40 to 0.50 District heating mains 0.10 to 0.30 Heating mains within boiler rooms 0.70 to 0.90

#### 6 Expansion tank

(a) Open tank (For LPHW only)

Expansion of water from  $7^{\circ}$ C to  $100^{\circ}$ C = approx. 4%.

Requisite volume of expansion tank = 0.08X water contents of system. Water content for typical system is approximately 1 litre for every 1 m<sup>2</sup> of radiator surface.

(b) Closed tank

$$V_{
m t} = V_{
m e} rac{p_{
m w}}{p_{
m w}-p_{
m i}} \qquad V_{
m e} = V_{
m w} rac{arrho_1-arrho_2}{
ho_2}$$

where

 $V_{\rm t} = \text{volume of tank (m}^3)$ 

 $V_{\rm e}$  = volume by which water content expands (m<sup>3</sup>)

 $V_{\rm w} = \text{volume of water in system (m}^3)$ 

 $p_{\rm w}$  = pressure (absolute) of tank at working temperature (kN/m<sup>2</sup>)

 $p_i = \text{pressure (absolute)}$  of tank when filled cold (kN/m<sup>2</sup>)

 $\varrho_1 = \text{density of water at filling temperature (kg/m}^3)}$ 

 $\varrho_2$  = density of water at working temperature (kg/m<sup>3</sup>)

 $p_{\rm w}$  to be selected so that working pressure at highest point of system corresponds to a boiling point approximately 10 K above working temperature.

 $p_{\rm w}$  = working pressure at highest point + static pressure difference between highest point and tank  $\pm$  pump pressure (+ or - according to position of pump).

Either  $p_i$  or  $V_t$  can be chosen independently to determine value of the other.

#### Approximate size of expansion tank for LPHW

# Safety valves

Safety valve setting = pressure on outlet side of pump  $+70 \text{ kN/m}^2$ .

For gravity systems, safety valve setting = pressure in system  $+15 \text{ kN/m}^2$ .

To prevent leakage due to shocks in system, it is recommended that the setting should be not less than 240 kN/m<sup>2</sup>.

Valves should have clearances to allow a lift of  $\frac{1}{5} \times$  diameter.

# Safety valve sizes for water boilers

# **Underfloor** heating

0.200

0.310

Underfloor heating uses pipes embedded in the floor structure. The pipes carry hot water which can be provided by any of the usual sources. Heat is transferred from the pipes to the floor and the room or space is heated by low temperature radiation from the entire surface of the floor.

Proprietary systems are available from a number of manufacturers.

0.430

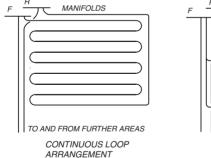

#### Pipe material:

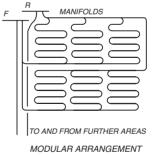

82 - 164

Plastic, e.g. polyamide base thermoplastic or cross-linked polyethylene.

#### Pipe arrangement:

Continuous loops or modules between flow and return pipes.

#### Pipe sizes:

Small bore, 10 mm nb to 22 mm nb

#### Pipe spacing:

300 mm centres

#### Flow temperature:

38°C to 60°C

#### Temperature drop:

5 to 15 K

#### Floor surface temperature:

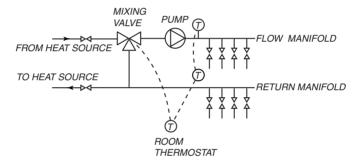

2 to 4 K above room temperature, dependent on floor finish and covering

#### Output:

70 to 130 W/m $^2$ 

Layout of pipes is generally determined by manufacturer or supplier of proprietary system. Installation by heating contractor in accordance with supplier's recommendations.

Individual loops or sections connected to common flow and return manifolds. A pump and mixing valve are included in the manifold assembly. Control is by mixing valve actuated in accordance with signals from a room thermostat and water flow and return temperature detectors. If required, loops from common manifolds can be controlled individually by thermostatic valves. Manifold assemblies and controls are normally included in the proprietary manufacturer's supply.

ASSEMBLY TO BE POSITIONED ABOVE FLOOR LEVEL IN CUPBOARD, STORE, OR OTHER SUITABLE LOCATION

#### TYPICAL MANIFOLD ASSEMBLY

#### Advantages:

Even heating, small temperature gradient through room.

Loops can be arranged to overcome down draughts at windows.

No wall space taken up.

No high temperature surfaces, therefore safer for children, the elderly and the infirm.

No convection currents, no staining of decorations, reduced air infiltration and therefore lower heat loss.

Larger lower temperature heating surface produces comfort at lower air temperature (about 2 K), therefore reduced heating requirement.

Low flow temperature makes system suitable for condensing boilers.

Rapid response to thermostatic control.

#### **Disadvantages:**

Extra insulation needed on underside of floor.

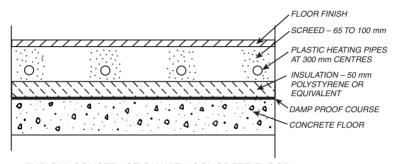

Floor construction may have to be heavier and deeper than would otherwise be necessary.

Difficult to modify after installation.

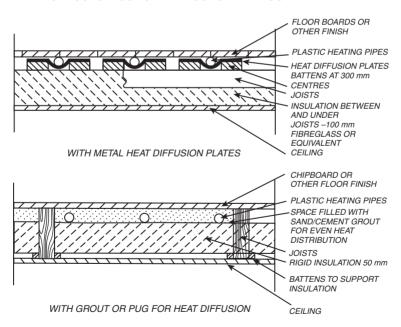

Higher capital cost than radiator system.

#### **Applications:**

Hospitals, housing, old people's homes, sports halls, assembly halls.

TYPICAL CONSTRUCTION WITH CONCRETE FLOOR

TYPICAL CONSTRUCTIONS WITH TIMBER FLOORS

# Off peak (storage) heating

Electricity is used during off peak periods to heat thermal stores from which the heat is then extracted during periods when heat is required. The stores are usually made of stone or artificial blocks having a high specific heat capacity.

#### Rating of unit

$$Q_1 = rac{100 \; Q_2 T_2}{\eta \; T_1}$$

where

 $Q_1 = \text{input rating of unit (kW)}$ 

 $Q_2$  = heat output required (kW)

 $T_1 =$ duration of input to unit (hr)

 $T_2 = \text{duration of heating period (hr)}$ 

 $\eta = \text{storage efficiency (\%)}$ 

The storage efficiency allows for loss of heat from the store during the charging period. It is 90-95%.

# Electrode systems

For large plants electrode boilers with water as a storage medium may be used.

Safe storage temperature is approximately 10°C below the boiling temperature at the operating pressure.

#### Capacity of storage vessel

$$V = \frac{1000\,H}{4.2\,\varrho(t_1-t_2)}$$

where

V = capacity of vessel (litre)

H = heat to be stored (kJ)

 $\rho = \text{density of water at storage temp. (kg/m}^3)$ 

 $t_1 = \text{storage temperature (°C)}$ 

 $t_2 = \text{return temperature (°C)}$ 

#### Boiler rating

$$Q = \frac{H}{3600 \ T}$$

where

Q = boiler rating (kW)

H = heat to be stored (kJ)

T = duration of boiler opeation (hr)

#### Heat pumps

The heat pump is a common refrigeration unit arranged in such a way that it can be used for both cooling and heating, or for heating only. The initial cost of the installation is high, and savings and advantages are achieved mainly when heating and cooling are required in winter and summer respectively.

#### Operation of the heat pump:

Referring to the scheme drawing below, the heat pump consists of the following parts:

Compressor, with driving motor, for raising the pressure and temperature of the refrigerant vapour.

Condenser, for extracting heat from the refrigerant.

**Receiver** (storage tank) to hold the liquid refrigerant in the high pressure side before it passes the expansion valve.

**Expansion valve,** for causing expansion of the refrigerant and for lowering the pressure from the high pressure to the low pressure side of the system.

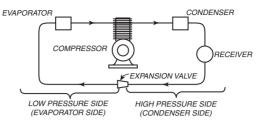

Evaporator, in which heat is absorbed by the refrigerant from some source. Water, earth or air can be used as the source of heat.

A commercial refrigeration unit and heat pump consist of the same units and the same plant can be used either for cooling or heating.

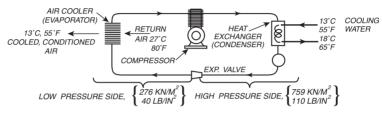

The changing of the system from cooling to heating can be carried out by either of the following methods

- Leave the flow of the refrigerant unchanged and change the circuit of the heat source and the medium to be heated.
- Leave the heat source and the medium to be heated unchanged and reverse the flow of the refrigerant by a suitable pipe and valve scheme.

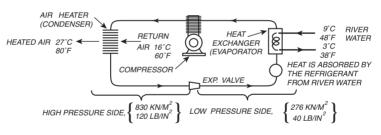

Schemes for a heat pump indicating suitable temperatures when used for cooling and heating are shown, the data being chosen for the purpose of illustration only.

# 9 Steam systems

#### Steam heating

Steam carries heat through pipes from the boiler to room or space heaters.

This is now seldom used as a method of space heating. This section is included for reference when old systems have to be examined or altered, and for design of systems in industrial premises where steam is available and steam-to-water calorifiers cannot be justified. Steam is also used for process heating in industry and the data in this section can also be used for pipe sizing.

#### Classification of steam heating systems

- 1 By pressure
  - (a) High pressure steam heating system
  - (b) Low pressure steam heating system
    Up to about 3 lb/in<sup>2</sup> or 20 kN/m<sup>2</sup>
  - (c) Vacuum system
- 2 By method of returning condensate
  - (a) Gravity system
  - (b) Mechanical system
- 3 By pipe scheme
  - (a) One-pipe or two-pipe system
  - (b) Up-feed or down-feed system

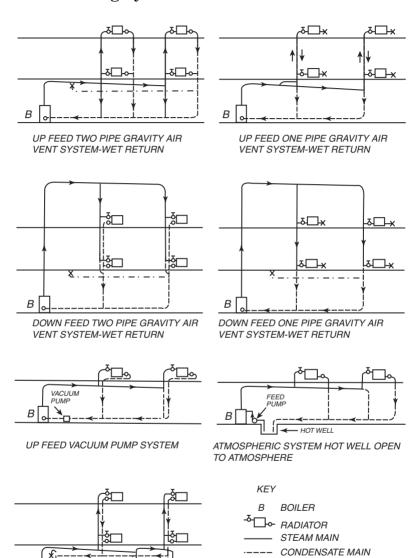

(See illustrations on page 136.)

- · - VENT PIPE

**VENT** 

→ RADIATOR VALVE STEAM TRAP

## Vacuum differential heating system

In vacuum steam heating systems, a partial vacuum is maintained in the return line by means of a vacuum pump. The vacuum maintained is approx. 3-10 in mercury = approx. 75-250 mm mercury.

TED IN KW.

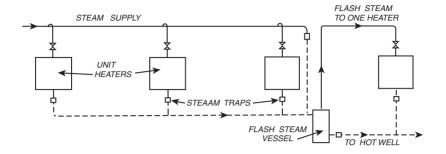

#### CHART 3. PIPE SIZES FOR HIGH PRESSURE STEAM

## Scheme of flash steam recovery

### Sizing steam mains

The Available Pressure Drop is the difference between the initial or boiler pressure and the required final pressure at the end of the line.

$$p=p_{\mathrm{i}}-p_{\mathrm{k}}$$

The available pressure drop is used to overcome friction in pipes and pressure losses in fittings.

$$p_{\rm t} = p_1 + p_2$$

For low pressure steam

$$p_1 = p_{
m a} l$$
  $p_2 = \sum F rac{v^2 arrho}{2}$ 

Alternatively

$$p_2 = p_{\rm a} l_{\rm e}$$

and

$$p_{\rm t} = p_{\rm a}(l + l_{\rm e})$$

 $p_a$  can be read from Chart 2 for given steam flow and pipe size.

For high pressure steam Chart 3 can be used. In this the auxiliary value  $b_x$ is used in place of the pressure drop per unit length.

$$b_{
m x} = b_{
m j} - b_{
m k}$$
  
 $b_{
m j} = p_{
m j}^{1.9375}$   
 $b_{
m k} = p_{
m k}^{1.9375}$ 

#### In the above formula

 $p_t = \text{total pressure drop in system (N/m}^2)$ 

 $p_i = \text{initial or boiler pressure (N/m}^2)$ 

 $p_{\rm k} = {\rm final \ pressure \ (N/m^2)}$ 

 $p_1$  = pressure loss in pipes due to friction (N/m<sup>2</sup>)

 $p_2 = \text{pressure loss in fittings (N/m}^2)$ 

 $p_a = \text{pipe friction resistance per length (N/m}^2)$ 

F = coefficient of resistance

v = steam velocity (m/s)

 $\varrho = \text{density of steam (kg/m}^3)$ 

l = length of pipe (m)

 $l_e =$  equivalent length of fitting (m)

Ratio  $p_2/p_1$  is generally about 0.33.

Total pressure drop is generally about 6 per cent of initial pressure per 100 m of pipe system.

#### Typical steam velocities

Exhaust steam 20-30 m/s(70-100 ft/s)Saturated steam 30-40 m/s(100-130 ft/s)Superheated steam 40-60 m/s(130-200 ft/s)

## 10 Domestic services

### Domestic hot water supply

#### Classification

Direct System. Secondary water is heated by direct mixing with boiler water in a hot water cylinder.

*Indirect system.* Secondary water is heated by indirect heating by primary water from boiler in an indirect cylinder or calorifier.

#### Design procedure for domestic hot water

- 1 Determination of demand (quantity and temperature).
- 2 Selection of type, capacity and heating surface of calorifier.
- 3 Selection of boiler.
- 4 Pipe scheme and pipe sizes.

#### 1 Demand

Hot water is normally stored and supplied at  $60^{\circ}$ C. For canteens and large kitchens it may be required at  $65^{\circ}$ C. Where lower temperatures are necessary for safety (e.g. nursery schools, centres for handicapped) it may be stored and supplied at a lower temperature (usually  $40^{\circ}$ – $50^{\circ}$ C) or stored and supplied at a higher temperature and reduced by mixing with cold water in a blender at the point of draw off.

Quantity is determined either according to number of occupants or according to number of fittings.

#### 2 Calorifier

$$H = \frac{4.2V(\theta_2 - \theta_1)}{3600 \, t}$$

where

H = heating capacity (kW)

V = volume stored (litre)

 $\theta_1$  = temperature of cold feed water (°C)

 $\theta_2$  = temperature of hot water (°C)

t = time in which contents are to be raised from  $\theta_1$  to  $\theta_2$  (hr)

For instantaneous heating (non-storage calorifier or direct heater).

$$H = 4.2 \upsilon (\theta_2 - \theta_1)$$

where

v = demand in litre/s.

Storage systems are usually designed for t=1 hr or 2 hr. A shorter warming up time enables the volume of the calorifier to be reduced but may require a higher rate of heating.

Heating Surface

$$\begin{split} A &= \frac{1000\,H}{k\,\theta_{\rm m}} \\ \theta_{\rm m} &= \frac{\theta_{\rm f} - \theta_{\rm r} + \theta_2 - \theta_1}{2.3\log_{10}\theta_{\rm f} - \theta_1/\theta_{\rm r} - \theta_2} \end{split}$$

where

 $A = \text{heating surface of calorifier (m}^2)$ 

H = rate of heating (kW)

 $k = \text{heat transmission coefficient (W/m}^2 \text{ K)}$ 

 $\theta_{\rm m} = {\rm logarithmic}$  mean temperature difference (K)

 $\theta_{\rm f} = \text{primary flow temperature (°C)}$ 

 $\theta_r$  = primary return temperature (°C)

 $\theta_1$  = secondary inlet temperature (°C)

 $\theta_2$  = secondary final temperature (°C)

#### 3 Boiler

Boiler rating = Heating capacity of calorifier

Boiler with correct rating to be selected from manufacturers' catalogues.

#### Pipe sizes

Pipes can be sized as for hot water heating systems (see section 8, page 122).

Volume flow through pipes to draw offs is determined by maximum demand. Volume flow through return pipes of circulating system is made sufficient to keep temperature drop between flow and return connections of calorifier down to about 5 K.

For most schemes pipe sizing table on page 155 is satisfactory.

Pump duties can be determined as for hot water heating systems (see section 8, page 121).

## Precautions against legionellosis

Infection is caused by inhalation of airborne droplets containing viable legionella. Sources can be hot and cold water services, cooling towers, humidifiers, air washers.

Pipe lengths and dead legs as short as possible.

Design temperatures to be maintained by adequate insulation, including insulation of cold pipes to prevent rise of temperature.

Adequate access for regular cleaning.

Water should not stand for long periods in conditions where its temperature may rise above 20°C.

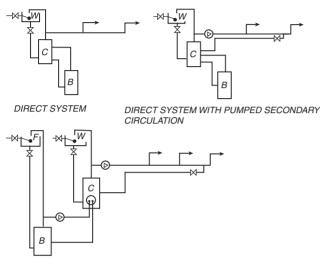

Hot water storage at 60°C with at last 50°C attained at outlets after one minute of running. Stratification in calorifiers to be avoided.

Cold water storage and distribution at 20°C or below.

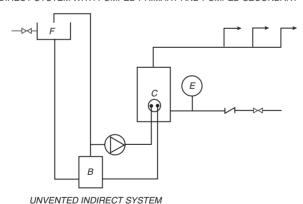

There is a risk of scalding at 43°C and above. Thermostatic mixing valves to be used as close as possible to outlets.

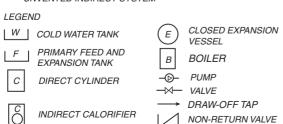

3. Alternatives to temperature control are water treatment by ionisation with copper and silver, dosing with chlorine dioxide, and biocidal treatment with ozone or ultra violet light.

#### Domestic hot water schemes

INDIRECT SYSTEM WITH PUMPED PRIMARY AND PUMPED SECONDARY

## Hot water consumption per fitting

	Consumpt	ion		Consumptio	$\overline{n}$
Fitting	litre/hr	gal/hr	Fitting	litre/hr	gal/hr
Basin (private)	14	3	Sink	45-90	10-20
Basin (public) Shower	45 180	10 40	Bath	90-180	20-40

## Hot water consumption per occupant

	Consumpt per occup		Peak dem		Storage per occupant		
Type of building	litre/day	gal/day	litre/hr	gal/hr	$\overline{litre}$	gal	
Factories (no process)	22-45	5-10	9	2	5	1

## Flow of gas in steel tubes

# 11 Ventilation

#### Ventilation

#### Classification by distribution

Central system. A central plant supplies air to the whole building. There can also be a central extract system.

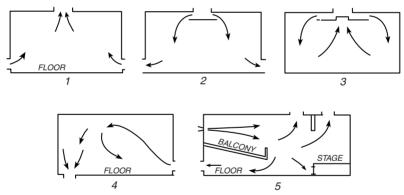

Unit system. Each room or area of the building has its own ventilating unit.

#### Classification by function

Split system of heating and ventilating. Heat losses through the fabric of the building are supplied by a radiator heating system and the ventilation delivers air at room temperature.

Combined system. A central ventilation plant supplies air above or below room temperature so that in cooling or heating to room temperature it provides the required heating or cooling as well as ventilation.

#### Schemes of air distribution

DIAGRAMMATIC VIEWS (IN ELEVATION) SHOWING HOW VARIOUS SYTEMS OF AIR DISTRIBUTION ARE APPLIED IN BUILDINGS.

- 1 Upward flow system
- 2 Downward flow system
- 3 High-level supply and return system
- 4 Low-level supply and return system
- 5 Ejector system

## Design procedure for ventilating system

- 1 Heating or cooling load, including sensible and latent heat.
- Temperature of air leaving grilles, calculated or assumed.
- Mass of air to be circulated.
- Temperature loss in ducts.
- Output of heaters, washers, humidifiers, coolers.
- 6 Boiler or heater size.
- Duct system and duct sizes.

#### Heating and cooling loads

Calculated with data in sections 6 and 7.

#### Supply air temperature

For heating  $38^{\circ} - 50^{\circ} \text{C} (100^{\circ} - 120^{\circ} \text{F})$ .

For cooling, inlets near occupied zones, 6°-8°C below room temperature  $(10^{\circ} - 15^{\circ} F)$ .

For cooling, high velocity diffusing jets. 17°C below room temperature  $(30^{\circ}F)$ .

#### 3 Air quantity

$$W = rac{H}{C(t_{
m d}-t_{
m r})} \qquad V = rac{H}{Carrho(t_{
m d}-t_{
m r})}$$

where

W = mass of air (kg/s)

 $V = \text{volume of air (m}^3/\text{s)}$ 

H = sensible heat loss or gain (kW)

C = specific heat capacity of air (= 1.01) (kJ/kg K)

 $\rho = \text{density of air } (= 1.21) \text{ (kg/m}^3)$ 

t<sub>d</sub> = discharge temperature of air at grilles (°C)

 $t_r = \text{room temperature (°C)}$ 

when moisture content is limiting factor

$$W = \frac{M}{w_2 - w_1}$$

where

W = mass of air (kg/s)

M =moisture to be absorbed (g/s)

 $w_1 = \text{humidity of supply air (g/kg)}$ 

 $w_2 = \text{humidity of room air (g/kg)}$ 

Alternatively, the air quantity is determined by the ventilation requirements of the occupants or process in the various rooms.

It is a disadvantage of the Combined System that the air quantity necessary to satisfy the heating or cooling requirement is not always the same as that necessary to satisfy the ventilation requirement and an acceptable compromise is not always easy to find.

#### Temperature drop in ducts

$$WC(t_1-t_2) = Ak\left(\frac{t_1+t_2}{2}-t_r\right)$$

where

W = mass of air flowing (kg/s)

C = specific heat capacity of air (= 1.01) (kJ/kg K)

 $A = \text{area of duct walls (m}^2)$ 

 $k = \text{heat loss coefficient of duct walls (kW/m}^2 \text{ K)}$ 

 $t_1 = \text{initial temperature in duct (°C)}$ 

 $t_2 = \text{final temperature in duct (°C)}$ 

 $t_{\rm r}$  = surrounding room temperature (°C)  $k = 5.68 \times 10^{-3} \ {\rm kW/m^2} \ {\rm K}$  for sheet metal ducts  $= 2.3 \times 10^{-3} \ {\rm kW/m^2} \ {\rm K}$  for insulated ducts.

For large temperature drops the logarithmic mean temperature should be used. The equation then becomes

$$WC(t_2-t_1) = Ak\frac{(t_1-t_{\rm r})-(t_2-t_{\rm r})}{\log_{\rm e}(t_1-t_{\rm r})/(t_2-t_{\rm r})}$$

#### Heaters, washers, humidifiers, coolers

Units with required combination of air quantity, heating or cooling capacity, humidifying or dehumidifying capacity to be selected from manufacturers' catalogues.

#### Boiler

$$B = H(1 + X)$$

where

B = boiler rating (kW)

H = total heat load of all heater units in system (kW)

X = margin for heating up and design uncertainties (0.15 to 0.20)

Boiler with correct rating to be selected from manufacturers' catalogues.

#### 7 Duct sizes

$$egin{aligned} v &= rac{Q}{A} \ p_t &= p_1 + p_2 + p_3 \ p_1 &= il \ i &= rac{2f arrho v^2}{d} \ p_2 &= \sum rac{K v^2 arrho}{2} \end{aligned}$$

where

v = air velocity (m/s)

 $Q = \text{air volume (m}^3/\text{s)}$ 

A = cross section of duct (m<sup>2</sup>)

 $p_t$  = total pressure loss in system (N/m<sup>2</sup>)

 $p_1$  = pressure loss in ducts due to friction (N/m<sup>2</sup>)

 $p_2$  = pressure loss in fittings (N/m<sup>2</sup>)

 $p_3$  = pressure loss in apparatus (filters, heaters, etc.) (N/m<sup>2</sup>)

 $i = \text{duct friction resistance per unit length (N/m}^2 \text{ per m run)}$ 

f = friction factor, which is a function of Reynolds number

K = coefficient of resistance for fitting

 $\varrho = \text{density of air (kg/m}^3)$ 

d = diameter of duct (m)

i can be obtained from Chart 4.

For rectangular ducts the equivalent diameter must be used

$$d=1.26\sqrt[5]{rac{{\left(ab
ight)}^3}{a+b}}$$

where

d = equivalent diameter (m)

a, b = sides of rectangular duct (m)

For standard air

$$arrho=1.21\,\mathrm{kg/m^3}$$
  $p_2=K\Big(rac{v}{1.29}\Big)^2\,\mathrm{N/m^2}$  with  $v$  in m/s

diseases Offices	0.05 0.016	smoking can occur	0.028

### Ventilation rates, occupancy unknown

Type of building	Air changes per hour	Type of building	Air changes per hour
Assembly halls	5-10	Laundries	10-15
Baths	5-8	Libraries	3-4
Boiler rooms	4	Offices	3-8
Cinemas	5-10	Museums	3-4
Conference rooms	6-10	Restaurants	7-15
Department stores	3-8	Sports halls	6
Dry stores	10	Supermarkets	3-8
Engine rooms	4	Swimming pools	5-10
Factories	6	Theatres	5-10
Garages	6	Toilets	6-10
Kitchens	10-60		
Laboratories	4-15		

#### Garage ventilation

Two thirds total extract at high level, one third at low level

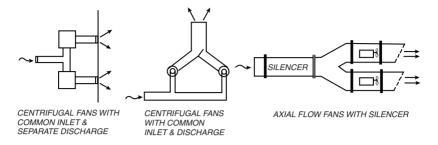

#### Bathroom and W.C. ventilation

Six air changes per hour or 0.018 m<sup>3</sup>/s per room.

To provide a standby service two fans with an automatic changeover switch are installed.

Proprietary units incorporating two fans with automatic changeover are widely used. Alternatively individual fans can be joined by ducting and the

changeover control supplied separately. Typical schemes for this are

## Theoretical velocity of air (due to natural draught)

$$V = 4.43 \sqrt{\frac{h(t_{\rm c} - t_{\rm o})}{273 + t_{\rm o}}} \qquad \begin{array}{c} V = {\rm theoretical\ velocity\ (m/s)} \\ h = {\rm height\ of\ flue\ (m)} \\ t_{\rm c} = {\rm temperature\ of\ warm\ air\ column\ (^{\circ}C)} \\ t_{\rm o} = {\rm temperature\ of\ outside\ air\ (^{\circ}C)} \\ V = {\rm in\ ft/s} \\ V = 8.02 \sqrt{\frac{h(t_{\rm c} - t_{\rm o})}{460 + t_{\rm o}}} \qquad \begin{array}{c} V = {\rm theoretical\ velocity\ (m/s)} \\ h = {\rm height\ of\ flue\ (m)} \\ t_{\rm c} = {\rm temperature\ of\ outside\ air\ (^{\circ}C)} \\ \end{array}$$

 $p = \text{velocity pressure N/m}^2$ 

## Air velocities and equivalent pressures

$$p = \frac{V^2 \varrho}{2}$$

$$= 0.6V^2$$

$$V = \text{velocity m/s}$$

$$\varrho = \text{density of air} = 1.2 \text{ kg/m}^3$$

$$V = \text{velocity head in water gauge}$$

$$V = \text{velocity ft/min}$$

$$\varrho = \text{density of air} = 0.075 \text{ lb/ft}^3$$

 $= \frac{}{16\,000\,000}$ 

#### **Filters**

#### **Dust load for filters**

 $mg/m^3$ Rural and suburban districts 0.45 - 1.00Metropolitan districts 1.0 - 1.8Industrial districts 1.8 - 3.5

#### Types of filter

(a) Washers

> Overall length about 20 m Air velocity through washer 2.5 m/s0.5 to 0.8 litre per m<sup>3</sup> air Water quantity required Water pressure required for spray nozzles 140-170 kN/m  $35-70 \text{ kN/m}^2$ Water pressure required for flooding nozzles

(b) Dry filters

Felt, cloth, cellulose, glass, silk, etc. without adhesive liquid

Panel type - disposable Air velocity 0.1-1.0 m/s $25-250 \text{ N/m}^2$ Resistance Continuous roll – self cleaning

Air velocity 2.5 m/sResistance  $30-175 \text{ N/m}^2$ 

- Viscous filters (c)
  - Panel type cloth with viscous fluid coating washable or disposable Plates about 500 mm×500 mm 1.5-2.5 m/sAir velocity  $20-150 \text{ N/m}^2$ Resistance
  - (ii) Continuous roll continuously moving, self cleaning Air velocity 2.5 m/s $30-175 \text{ N/m}^2$ Resistance
- (e) Electrostatic precipitators

Cleaned automatically Air velocity 1.5-2.5 m/sResistance negligible

Absolute(f)

> Dry panel with special coating – disposable or self cleaning Air velocity 2.5 m/s

 $250-625 \text{ N/m}^2$ Resistance

## Resistance of ducts. (Allowance for surface conditions)

Surface	Chart reading to be multiplied by

## Pressure drop in apparatus. (Usually given by manufacturers)

	Average pressure drop		
Apparatus	$\overline{(N/m^2)}$	(in w.g.)	
Filters	50 to 100	$\frac{3}{16}$ to $\frac{3}{8}$	
Air washers	50 to 100	$\frac{3}{16}$ to $\frac{3}{8}$	
Heater batteries	30 to 100	$\frac{1}{8}$ to $\frac{3}{8}$	

## Recommended velocities for ventilating systems

	Velocity					
	Public buildings Industrial		ıl plant			
Service	m/s	ft/min	m/s	ft/min		
Air intake from outside	2.5-4.5	500-900	5-6	1000-1200		
Heater connection to fan	3.5 - 4.5	700-900	5-7	1000-1400		
Main supply ducts	5.0 - 8.0	1000-1500	6-12	1200-2400		
Branch supply ducts	2.5-3.0	500-600	4.5-9	900-1800		
Supply registers and grilles	1.2 - 2.3	250 - 450	1.5 - 2.5	350 - 500		
Low level supply registers	0.8 - 1.2	150 - 250	_	_		
Main extract ducts	4.5-8.0	900-1500	6-12	1200-2400		
Branch extract ducts	2.5 - 3.0	500-600	4.5 - 9	900-1800		

Velocities in natural draught extract systems should be 1-3 m/s (200-600 ft/min).

## Thickness of ducts

Rectangular

Longest Side		Thickness			
mm	in	Up to 1000 pa mm	1001 pa to 2000 pa mm		
400	15	0.6	0.8		
600	24	0.8	0.8		
800	32	0.8	0.8		
1000	40	0.8	0.8		
1250	48	1.0	1.0		
1600	63	1.0	1.0		
2000	78	1.0	1.2		
2500	96	1.0	1.2		
3000	118	1.2	_		

		Thickness				
Circular diameter		Spirally wound up to 2000 pa	Straight seamed			
			up to 1000 pa	1001 pa to 2000 pa		
mm	in	mm	mm	mm		
80	3	0.4	0.6	0.8		
160	6	0.5	0.6	0.8		
200	8	0.5	0.6	0.8		
315	12	0.6	0.6	0.8		
500	20	0.6	0.8	0.8		
800	32	0.8	0.8	1.0		
1000	40	1.0	1.0	1.2		
1500	60	1.2	1.2	1.2		

Ducts outside buildings exposed to atmosphere should be 0.2 mm thicker.

## Beaufort wind scale

D ( )	Wind speed				ed	
Beaufort No.	Description of wind	Observation	mph	ft/min	m/s	
0 1	Calm Light air	Smoke rises vertically Direction of wind shown by smoke drift but not by wind vanes	0-0.3 0.3-6	0-25 25-525	0-0.15 0.15-2.7	
2	Light breeze	Wind felt on face; leaves rustle; ordinary vanes moved by wind	6-8	525-700	2.7-3.6	
3	Gentle breeze	Leaves and small twigs in constant motion; wind extends light flag	8-16	700-1400	3.6-7.2	
4	Moderate breeze	Raises dust and loose paper; small branches moved	16-20	1400-1800	7.2-8.9	
5	Fresh breeze	Small trees in leaf begin to sway	20-28	1800-2500	8.9-12.5	
6	Strong breeze	Large branches in motion; whistling heard in telegraph wires	28-32	2500-2800	12.5-14.5	
7	Moderate gale	Whole trees in motion; inconvenience felt when walking into wind	32-44	2800-3900	14.5-20	
8	Gale	Twigs broken off trees; generally impedes progress	44-50	3900-4400	20-22	
9	Strong gale	Slight structural damage, e.g. slates and chimney pots removed from roofs	50-62	4400-5450	22-28	
10	Storm	Trees uprooted; considerable structural damage	62-70	5450-6150	28-31	
11	Violet storm	Widespread damage	70-82	6150-7200	31-37	
12	Hurricane		> 82	> 7200	> 37	

Chill effect is the cooling effect of air movement. It is defined as the reduction in dry bulb air temperature which would give the same cooling effect in still air.

Air velocity		Chill effect		
m/s	ft/min	$^{\circ}C$	$^{\circ}F$	
0.1	20	0	0	
0.25	50	0.5	2	
1.5	300	4	7	
3	600	6	10.5	
5	1000	7	13	
8	1575	8	15	
10	2000	9	16

Duct sizes below thick line have aspect ratios greater than 4:1 and should be avoided for reasons of friction and noise.

#### Natural ventilation

Relies on natural forces of wind and temperature differences to generate flow of air

#### Advantages

Absence of mechanical components.

No plant room needed.

Reduction in building energy requirements.

#### **Disadvantages**

Close control not practicable.

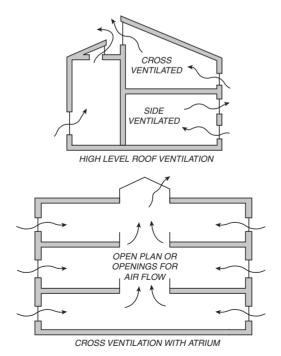

Incoming air cannot be filtered.

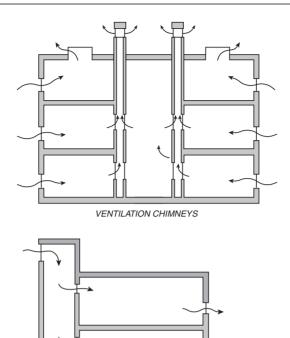

Difficult to exclude external noise.

Paths for flow of air must form part of architectural building design.

Cost saving of mechanical plant may be offset by increased cost of special building components.

# Typical schemes

Mixed mode ventilation

Mechanical ventilation is used in winter to avoid cold draughts and natural ventilation in summer to save energy.

WIND SCOOP

# Design requirements

Inlets and air paths to be arranged to avoid draughts.

Internal heat gains to be kept to a minimum.

Solar heat gain through glazing to be limited.

A higher room temperature is acceptable than with full air conditioning.

Daylighting and natural ventilation are improved by increased floor to ceiling height.

Building shape to ensure adequate wind pressure difference between inlet and outlet opening.

Air leakage through building joints and materials to be kept to a minimum. For controllable nature ventilation air tightness not to exceed 5 m<sup>3</sup>/hr per m<sup>2</sup> facade.

Openings to be adjustable and well sealed when closed to allow for difference in wind and stack effects between winter and summer.

Fire dampers to be provided at openings in fire walls.

Consideration to be given to sound insulation.

Supply air to interior areas not to pick up contamination from occupants and equipment in external areas.

# Design procedure

- 1 Air flow requirements for summer cooling.
- Selection of inlet and outlet ventilation openings.
- 3 Driving pressure due to wind and stack effects.
- 4 Resistance of flow path.
- Size of ventilation openings to give required flow rate.

#### 1 Air flow

Flow required for cooling calculated as for mechanical ventilation.

Computer programs take account of effect of thermal mass of building over 24 hour period.

For natural ventilation room air temperature can be higher than with full air conditioning.

#### 2 Openings

Windows

Trickle ventilators

Louvres

Underfloor ducts

Chimney type stacks

Dampers - manual or automatic control

#### Driving pressure

#### (a) Wind pressure

Driving pressure due to wind is difference between wind pressures on inlet and outlet sides of building.

$$P_{\rm w} = 0.5 C_{\rm p} \varrho V_{\rm w}^2$$

where

 $P_{\rm w} = \text{Wind pressure (N/m}^2)$ 

 $C_{\rm p} = \text{Wind coefficient on wall}$ 

 $V_{\rm w} = \text{Wind speed (m/s)}$ 

 $\rho = \text{Density of air (kg/m}^3)$ 

Data on wind coefficients has been published by Air Infiltration and Ventilation Centre, Coventry.

#### (b) Stack effect

Driving pressure due to stack effect

$$\Delta P_{
m s} = arrho_{
m i} ghrac{(T_{
m i} - T_{
m o})}{T_{
m o}}$$

where

$$\begin{split} \Delta P_{\rm s} &= {\rm stack\ driving\ pressure\ (N/m^2)} \\ \varrho_{\rm i} &= {\rm density\ of\ internal\ air\ (kg/m^3)} \\ g &= {\rm acceleration\ of\ gravity} = 9.81\ m/s^2 \\ h &= {\rm difference\ in\ height\ of\ inlet\ and\ outlet\ openings\ (m)} \\ T_{\rm i} &= {\rm internal\ temperature\ (^{\circ}K)} \\ T_{\rm o} &= {\rm outside\ temperature\ (^{\circ}K)} \end{split}$$

#### 4 Resistance of flow path

To be calculated as for large ducts with low air velocity.

#### 5 Size of openings

Pressure drop across openings = total driving pressure-pressure drop through building.

$$A = \frac{Q}{C_d} \left[ \frac{\varrho}{2\Delta P} \right]^{1/2}$$

where

 $A = \text{area of opening (m}^2)$ 

 $Q = \text{air flow (m}^3/\text{s)}$ 

 $C_{\rm d} = {\rm discharge}$  coefficient (can be taken as 0.61)

 $\varrho = \text{density of inside air (kg/m}^3)$ 

 $\Delta P = \text{pressure drop across opening (N/m}^2)$ 

# Fume and dust removal

#### Equipment for industrial exhaust systems

- A Suction hoods, booths, or canopies for fume and dust collection, or suction nozzles, or feed hoppers for pneumatic conveying.
- B Conveying, ducting or tubing.
- C Fan or exhauster to create the necessary pressure or vacuum for pneumatic conveying.
- D Dust separator, for separating the conveyed material from the conveying air.

#### Classification of schemes

**Pneumatic conveying plants** are suitable for conveyance of material in powdered form or in solids up to 50 mm size, dry: not more than 20% moisture, not sticking.

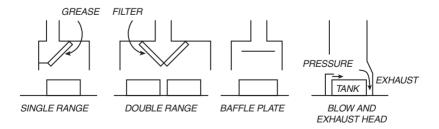

Efficiency of pneumatic conveying plants is low but compensated by easy handling, free of dust.

**Suction type** – Distance of conveying up to 300 m difference in heights up to 40 m. Required vacuum 200 to 400 mm mercury.

**Pressure type** – Distance of conveying above 300 m working pressure up to 40 kN/m<sup>2</sup>. Advantage: possibility of conveying material over long distance by connecting more systems in series.

Working pressure above 40 kN/m<sup>2</sup> not suitable, because of high running cost.

# Types of hoods

A flow of air into the hood resists cross draughts which would carry fumes and convected heat from appliances into the room.

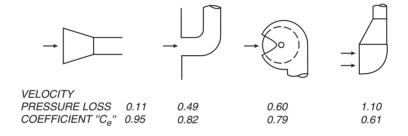

Projection of hood beyond range 300 mm. Projection to be beyond open position of oven doors. Underside of hood 2000-2100 mm above floor level. Extract air velocity across face of hood 0.25 to 1.5 m/s. Mechanical supply air 85% of extract, 15% by natural infiltration.

Face velocity of mesh type grease filter 2-5 m/s, for baffle type 5 m/s.

# Recommended velocities through top hoods and booth, subject to cross draughts in m/s

Canopy hood, open	1.0 - 1.5	Canopy hood, double	5.0
Canopy hood, closed 1 side	0.9 - 1.0	Booths, through 1 side	0.5 - 0.75
Canopy hood, closed 2 sides	0.75 - 0.9	Laboratory hoods,	
Canopy hood, closed 3 sides	0.5 - 0.75	through doors	0.25 - 0.35

# Coefficients of entry and velocity. Pressure loss of duct extraction hoods

#### Flow of air into a hood

$Q{=}1.3$ $C_{ m e}A_{ m t}\sqrt{h_{ m t}}$	$Q = 4000~C_{ m e}A_{ m t}\sqrt{h_{ m t}}$ $Q = { m Air~volume~ft}^3/{ m min}$
$Q = \text{Air volume m}^3/\text{s}$	$Q = \text{Air volume ft}^3 / \text{min}$
$C_{\rm e} = { m Entrance}$ coefficient	$C_{ m e}={ m Entrance}$ coefficient
$A_{\rm t} = {\rm Area~of~throat,~m}^2$	$A_{\rm t}\!=\!{ m Area}$ of throat, ${ m ft}^2$
$h_{\rm t} = { m Static}$ suction in throat,	$h_{\rm t} = { m Static \ suction \ in \ throat},$
$N/m^2$	inches w.g.

#### Coefficient of entry

#### Entrance loss into hood

$$C_e = \sqrt{rac{h_{
m v}}{h_{
m t}}} \ (h_{
m v} = {
m velocity \ pressure}) \quad C_e h_{
m t} = rac{\left(I-C_e^2
ight)}{C_e^2} h_{
m v}$$

The transporting velocity for material varies with the size, specific gravity and shape of the material (Dalla Valle)

#### Vertical lifting velocity

$$V = 10.7 \frac{s}{s+1} \times d^{0.57}$$
  $V = 13300 \frac{s}{s+1} \times d^{0.57}$ 

#### Horizontal transport velocity

$$V = 8.4 \frac{s}{s+1} \times d^{0.40}$$
  $V = 6000 \frac{s}{s+1} \times d^{0.40}$   $V = Velocity m/s$   $V = Velocity ft/min$   $S = Specific gravity of material  $S = Specific gravity of material$$$$$$$$$$$$$$$$$$$$$$$$$ 

#### Friction loss of mixture

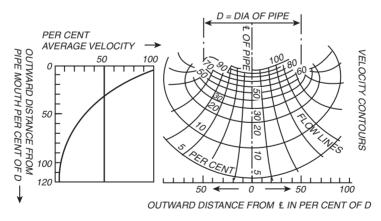

particle in mm

$$\frac{F_{\rm m}}{F_{\rm a}} = 1 + 0.32 \left(\frac{W_{\rm s}}{W_{\rm a}}\right)$$

particle in in.

where

 $F_{\rm m} = \text{Friction loss of mixture}$  $F_a = Friction loss of air$  $W_{\rm s} = {
m Mass}$  of solid  $\bar{W_{\rm a}} = {
m Mass}$  of air

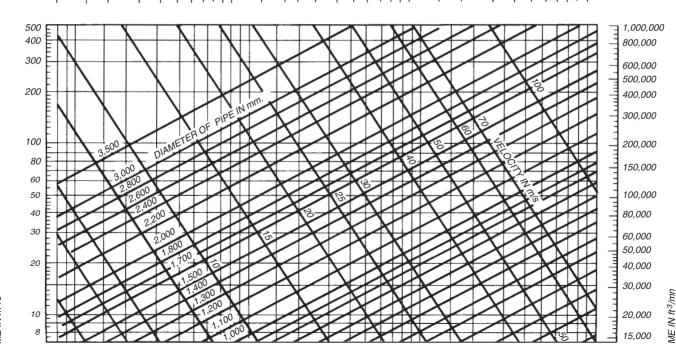

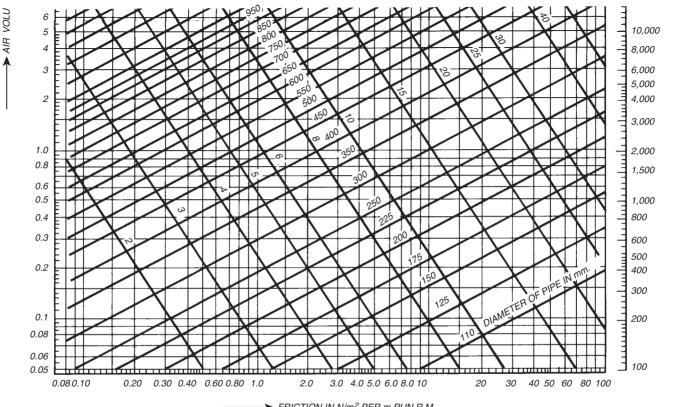

Velocity contours and flow directional lines in radial plane of circular suction pipe.

#### CHART 4. DUCT SIZING FOR VENTILATION SCHEMES

# Defogging plants

The defogging of rooms is carried out by blowing in dry, hot air and exhausting humidified air.

Mass of water evaporated from open vats

$$\frac{W}{A} = (0.037 + 0.032 \,\nu) \times 10^{-3} (p_{\rm s} - p_{\rm w})$$

where

W = mass of water evaporated, kg/s

 $A = \text{surface area. m}^2$ 

 $\nu = \text{velocity of air over surface, m/s}$ 

 $p_s$  = pressure of saturated vapour at temperature of water, kPa

 $p_{\rm w}$  = actual pressure of water vapour in the air, kPa

#### Mass of air to be circulated

$$G = \frac{W}{(w_2 - w_1)}$$

where

G = Mass of air, kg/s

W = Mass of water vapour to be removed, kg/s

 $w_1 = \text{Original absolute humidity of air, kg/kg}$ 

 $w_2 = \text{Final absolute humidity of air, kg/kg}$ 

#### Amount of heat

$$H = Gc (t_i - t_0)$$

where

H = Amount of heat, without fabric loss of room or other losses, W

G = Mass of air (see above), kg/s

 $t_i =$ Inside air temperature,  $^{\circ}$ C

 $t_{\rm o} = {\rm Outside}$  air temperature, °C

c =Specific heat capacity of air  $= 1.012 \times 10^3$  J/Kg  $^{\circ}$ C

# 12 Air conditioning

# Design procedure for air conditioning

- 1 Cooling load calculation
  - (a) Sensible heat load due to
    - (i) heat gain through walls, etc.
    - (ii) solar radiation.
    - (iii) heat emission of occupants.
    - (iv) infiltration of outside air.
    - (v) heat emission of lights and machinery.
  - (b) Latent heat load due to
    - (i) moisture given off by occupants.
    - (ii) infiltration of outside air.
    - (iii) moisture from process machinery.
- 2 Selection of air treatment process. For processes and psychrometric chart see pages 80, 81 and Chart 5.
- 3 Determination of air quantities.
- 4 Layout and sizing of ducts.
- 5 Determination of capacities of air treating units, allowing for heat gains in ducts.
- 6 Determination of refrigerator and boiler duties.
- 7 Determination of pump and fan duties.

# Methods of cooling air

- 1 Spray type washer.
- 2 Surface type cooler
  - Indirect. By heat exchange with water which has been cooled by a refrigerant.
  - (ii) Direct. By heat exchange in evaporator of a refrigerator system.

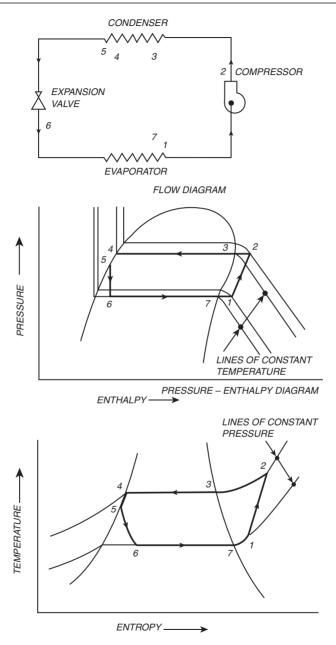

# Methods of refrigeration

#### 1 Compression system

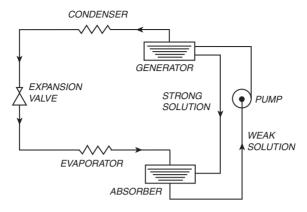

Hot compressed vapour leaves a compressor and is liquified in a condenser by heat exchange with cooling water or air. The liquid refrigerant then passes through an expansion valve and the low pressure liquid enters the evaporator. It absorbs heat from the medium to be cooled and is vaporised. The vapour enters the compressor and is raised to a higher pressure.

#### 2 Absorption system

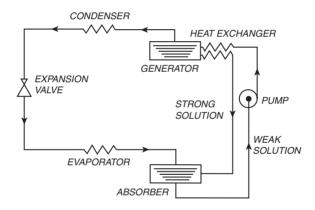

A solution of water in a solvent is raised to a high pressure and heated which causes the dissolved water to vaporise. The vapour is liquified in a condenser and then passes through an expansion valve. Now at low pressure the water enters the evaporator, absorbs heat from the medium to be cooled and vaporises. The vapour returns to be absorbed in the solvent.

TEMPERATURE - ENTROPY DIAGRAM VAPOUR COMPRESSION CYCLE

BASIC ABSORPTION CYCLE

ABSORPTION CYCLE WITH SOLUTION HEAT EXCHANGER

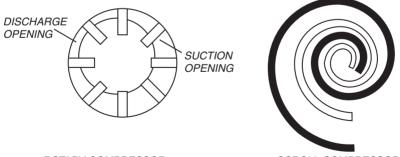

#### Types of system

- Cooling only (comfort cooling).
- Cooling or heating.
- Cooling or heating with control of humidity (full air conditioning).

In all systems heat is removed from the conditioned space and rejected to atmosphere outside the building.

#### Types of compressor

- 1. RECIPROCATING Pistons driven in cylinders by crankshaft. Suction and discharge valves are thin plates which open and close easily. Most widely used type. Step control by unloading cylinders.
- 2. CENTRIFUGAL Similar in construction to centrifugal pump. Vaned impeller rotates inside a casing and gas pressure is increased by centrifugal action. Suitable for very large capacities. Infinitely variable control by:
  - Variable speed drive a)
  - b) Suction throttle valve
  - c) Variable inlet guide vanes
- Two meshing helically shaped screws rotate and compress gas as the volume between them decreases towards the discharge side. Reliable, efficient and comparatively cheap. Used for larger duties. Infinitely variable control by bypassing partly compressed gas back to suction inlet.
- 4. ROTARY Rotor with blades sliding radially is eccentric to casing. As it turns gas is swept into a smaller volume. Has few parts and can be relatively quiet and vibration free. Used for small duties such as wall or window units.

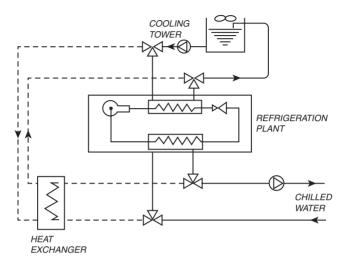

ROTARY COMPRESSOR

SCROLL COMPRESSOR

5. SCROLL Two helically shaped scrolls are interleaved in such a way that as they rotate the space between them decreases from the suction to the discharge openings and thus compresses the gas. Suitable for medium to large commercial applications.

#### Free cooling

At low ambient air temperatures chilled water to air conditioning systems can be cooled directly by cold water from the cooling tower and the refrigeration plant can be switched off.

DOTTED LINES SHOW CIRCUIT AT LOW AMBIENT TEMPERATURES
THREE WAY VALVES ARE CONTROLLED BY AMBIENT AIR WET BULB TEMPERATURE

#### Units

Cooling is expressed in the same units as heating, namely kW or Btu/hr.

Another unit much used formerly was the Ton of Refrigeration. This was the cooling produced when one American ton of ice melted at  $32^{\circ}F$  in 24 hours. Since the latent heat of melting ice at  $32^{\circ}F$  is 144 Btu/lb

1 ton of refrigeration = 2000 lb $\times$ 144 Btu/lb in 24 hours = 288 000 Btu in 24 hours = 12 000 Btu/hr = 3.517 kW

#### Air washer

Air washers are sheet metal, or sometimes brick or concrete chambers, in which air is drawn through a mist caused by spray nozzles and then through eliminators to remove particles of water not evaporated into the air. The water for the spray nozzles is recirculated by a pump and can be heated or cooled. A tempering heater is installed before, and a reheating battery after the air washer.

#### General data

Cleaning efficiency 70% on fine dust

98% on coarse dirt 2-3 m/s 450-550 ft/min

Air velocity through washer

Resistance Water pressure for sprays

 $50-140 \text{ N/m}^2 \ 0.2-0.5 \text{ in water gauge}$   $100-170 \text{ kN/m}^2 \ 15-25 \text{ lb/in}^2$   $0.45-0.55 \text{ l/m}^3 \text{ air } 3-3.5 \text{ gal per } 1000 \text{ ft}^3 \text{ air}$ Water quantity

Humidifying efficiency

$$E = \frac{t_1 - t_2}{t_1 - t_{\mathrm{w}}} \times 100\%$$

where

 $t_1 = \text{initial dry bulb temperature}$ 

 $t_2 = \text{final dry bulb temperature}$ 

 $t_{\rm w}$  = initial wet bulb temperature.

Typical efficiencies obtained are

60-70% with one bank of nozzles downstream

65-75% with one bank of nozzles upstream

85-100% with two banks of nozzles.

## Shell and tube cooler

Shell and tube coolers consist of plain or finned tubes in an outer shell. Air flows through the shell and a liquid coolant (water, brine or refrigerant) flows through the tubes. The air can be dehumidified as well as cooled by being cooled below its dew point so that part of the moisture is condensed.

#### Surface area of cooler

$$A = \frac{H}{U(t_{\rm a}-t_{\rm m})}$$

where

A =area of cooling surface (m<sup>2</sup>)

H = cooling rate (kW)

 $U = \text{heat transfer coefficient (kW/m}^2 \text{ K)}$ 

 $t_{\rm a}-t_{\rm m}\!=\!\log$  mean temperature difference between air and coolant (K)

#### Direct dehumidification

Classification

- 1 Adsorption type.
- 2 Absorption type.

#### Adsorption type

In adsorption systems the humidity is reduced by adsorption of moisture by an adsorbent material such as silica gel or activated alumina. Adsorption is a physical process in which moisture is condensed and held on the surface of the material without any change in the physical or chemical structure of the material. The adsorbent material can be reactivated by being heated, the water being driven off and evaporated.

The adsorption system is particularly suitable for dehumidification at room temperature and where gas or high pressure steam or hot water is available for reactivation.

Temperature for reactivation

160-175°C 325-350°F

Heat required for reactivation 4800-5800 kJ/kg water removed

2100-2500 Btu/lb water removed

Silica gel SiO<sub>2</sub>, is a hard, adsorbent, crystalline substance; size of a pea; very porous.

Voids are about 50% by volume.

Adsorbs water up to 40% of its own mass

Bulk density 480-720 kg/m<sup>3</sup>

Specific heat capacity 1.13 kJ/kg K

Activated alumina is about 90% aluminium oxide, Al<sub>2</sub>O<sub>3</sub>; very porous

Voids about 50-70% by volume

Adsorbs water up to 60% of its own mass

Bulk density 800-870 kg/m<sup>3</sup>

Specific heat capacity 1.0 kJ/kg K

#### Absorption type

In absorption systems the humidity is reduced by absorption of moisture by an absorbent material such as calcium chloride solution. Absorption involves a change in the physical or chemical structure of the material and it is not generally practicable to reactivate the material.

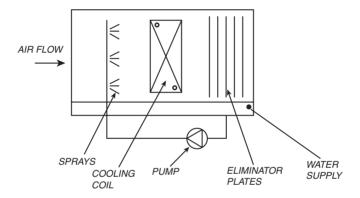

#### Humidification

Classification

- 1 Sprayed coil.
- Spinning disc.
- Steam humidifier.

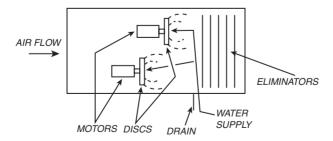

#### Sprayed coil

Water is discharged into the air stream flowing onto a finned cooling coil. The discharge is through banks of high-pressure nozzles which produce a finely divided spray of water droplets. The fins of the cooling coil provide additional surface on which the water evaporates into the air. Eliminator plates at the exit from the humidifier prevent carry over of unevaporated water droplets. Excess water is collected at the base of the unit and recirculated to the nozzles by a pump. Air velocity through unit 2.0-3.5 m/s.

#### Spinning disc

Water flows as a fine film over the surface of a rapidly revolving vertical disc. It is thrown off the disc by centrifugal action onto a toothed ring and broken up into fine particles.

#### Steam humidifier

Electrode-type steam generator delivers low pressure steam to a perforated distributor pipe in the air stream. Because the water is boiled this method reduces the risk of transferring water-borne bacteria to the air.

#### Precautions against legionellosis

Humidifiers creating a spray should be supplied with treated and disinfected water which is not allowed to stand in equipment or tanks. Cooling towers to be positioned away from air inlets and populated areas, to have high efficiency drift eliminators and have the section above the pond enclosed to reduce wind pick up. Water to be treated to reduce scale, sediments and bacteria.

Duct work to be designed so that water cannot accumulate in air stream. Drains to have air break.

# Air conditioning systems

#### 1 Self-contained wall or window unit

Unit mounted in wall or window with evaporator inside room and condenser outside room.

#### Advantages

Low cost.

Flexible.

Simple.

#### **Disadvantages**

Short life.

Noise.

Poor control.

Poor filtration and air distribution.

Lack of fresh air supply.

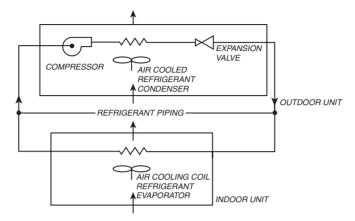

Unsightly.

#### **Applications**

Small buildings, individual rooms.

#### 2 Split direct expansion (DX) unit

Air cooled condenser is separate and remote from indoor unit. Compressor can be in either part but is usually in the outdoor unit.

#### Advantages

Indoor unit need not be on outside wall.

Indoor unit can be ceiling mounted.

Silencers can be incorporated for indoor unit.

Multiple refrigerant circuits give improved control.

Relatively simple.

#### Disadvantages

Restriction on length of refrigerant piping between indoor and outdoor

Restriction on difference in level between indoor and outdoor units. Limited fresh air supply.

#### **Applications**

Small shops, computer rooms, individual rooms or areas.

#### 3 Split system reversible heat pump

Split system direct expansion with changeover valves enabling functions of condensing and evaporating coils to be reversed.

#### Advantages

Similar to split cooling only system.

Provides winter heating as well as summer cooling.

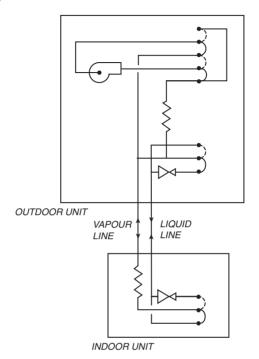

#### Disadvantages

Similar to split cooling only system.

Heating and cooling capacities not independent of each other.

## **Applications**

Small shops, individual rooms or areas.

VALVES IN POSITION SHOWN IN FULL LINES

- INDOOR UNIT EVAPORATES

- OUTDOOR UNIT CONDENSES

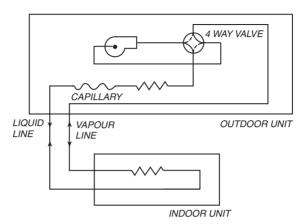

- INDOOR UNIT CONDENSES

- OUTDOOR UNIT CONDENSES

- OUTDOOR UNIT EVAPORATES

HEATED

For small duties the units are simplified by the use of a capillary which can operate in either direction instead of expansion valves.

#### 4 Water cooled unit

Self-contained indoor unit consisting of evaporator, compressor and water cooled condenser with separate outdoor cooling tower.

#### Advantages

Quieter than air cooled unit.

Flexibility in location of outdoor and indoor units.

Better control than air cooled units.

#### **Disadvantages**

Cooling water treatment advisable.

Maintenance of cooling water circuit.

#### **Applications**

Computer rooms.

#### 5 Glycol cooled unit

Self-contained indoor unit consisting of evaporator, compressor and glycol cooled condenser with remote forced draught glycol/air heat exchanger.

#### Advantages

No water treatment problems.

Protection against freezing.

#### **Disadvantages**

Need to ensure glycol is retained in system.

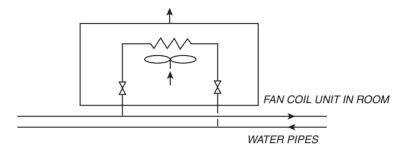

#### **Applications**

Computer rooms.

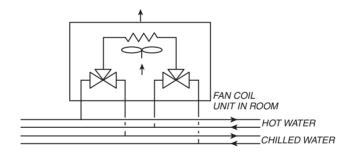

#### 6 Fan coil units

Chilled water or hot water is circulated from central plant to individual units in which room air is cooled or heated.

Two-pipe system. One pair of pipes used for chilled water in summer and for hot water in winter. Suitable for continental climate with sharp difference between summer and winter. Not suitable for temperate climate as in the United Kingdom.

(b) Four-pipe system. Separate pairs of pipes for chilled water and hot water. More expensive but more flexible control for use in temperate climates. Some rooms can be cooled while others are heated.

#### Advantages

Flexible.

Straightforward design.

Good control.

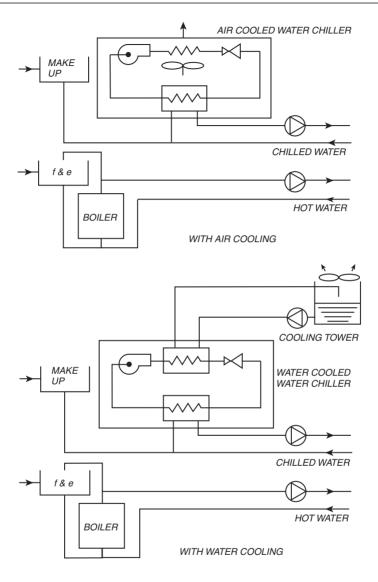

#### Disadvantages

Additional provision needed for fresh air supply.

Condense drain from each unit and/or separate provision for dehumidification.

#### **Applications**

Offices, hotel bedrooms, luxury housing, schools.

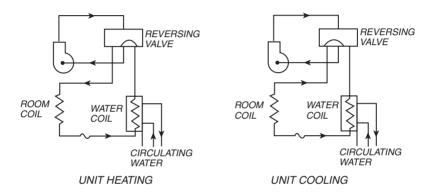

CENTRAL PLANT FOR FAN COIL SYSTEM

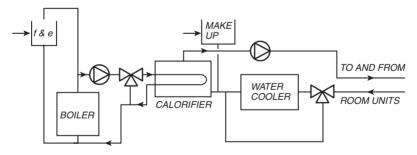

#### Design parameters

Chilled water flow to fan coils	$5^{\circ}\text{C}-10^{\circ}\text{C}$
Chilled water temperature rise in fan coils	5 K-6 K
Hot water flow to fan coils	$80^{\circ}\mathrm{C}$
Hot water temperature drop in fan coils	10 K

#### 7 Heat recovery units (Versatemp system from Temperature Ltd.)

Self-contained refrigeration/heat pump room units reject heat to water circulating throughout building when cooling or take heat from the water when heating. Heat rejected by units acting as coolers is supplied to units acting as heaters. Central plant to provide cooling and heating is needed to balance the cooling/heating loads.

CENTRAL PLANT FOR HEAT RECOVERY SYSTEM

#### Advantages

Energy conservation, particularly in temperate climates.

#### **Disadvantages**

Units are larger than fan coil units.

#### **Applications**

Offices.

#### Design parameters

Water flow to units controlled at 27°C.

Return from individual unit

when heating 19°C when cooling 38°C.

To achieve 27°C in summer conditions the circulating water must be cooled in a cooling tower.

Temperature Ltd offer an extended range of room units which operate with a water flow temperature of 37°C. This allows the circulating water to be cooled in a dry air blast cooler.

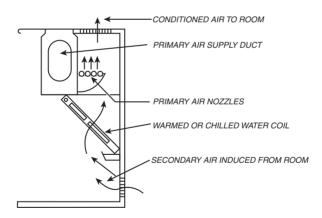

For water flow to units at 37°C return from individual unit

when heating 32°C when cooling 44°C.

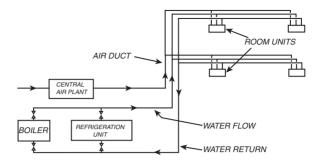

Disadvantage of operating at higher temperature is that room units are bigger for same duty.

#### 8 Induction system

A central air plant delivers conditioned air through high-velocity ducting to induction units in the rooms. Water from a central plant is also supplied to the induction units. The conditioned, or primary, air supplied to the units induces room, or secondary, air through the unit. This induced secondary air passes over the water coil and is thus heated or cooled.

- Two-pipe changeover system. One pair of pipes used for chilled water in (a) summer and for hot water in winter. Not suitable for temperate climate.
- (b) Two-pipe non-changeover system. One pair of pipes for chilled water only, with heating by primary air only.
- Four-pipe system. Separate pairs of pipes for chilled water and hot water. Lower running cost and better control than two-pipe non-changeover system.

#### Advantages

Space saving through use of high velocity and small diameter ducts.

Low running costs.

Individual room control.

Very suitable for modular building layouts.

Central air plant need handle only part of the air treated.

Particularly applicable to perimeter zones of large buildings.

Suitable for large heat loads with small air volumes.

#### Disadvantages

High capital cost.

Design, installation and operation are all more complex than with fan coil system.

Individual units cannot be turned off.

#### **Applications**

Offices.

#### Design parameters

0.012 m<sup>3</sup>/s per person or as needed Fresh air quantity

for ventilation

Air velocity in primary ducts

15-20 ms

Induction unit ratio secondary air/

primary air 3:1

 $200 \text{ N/m}^2$ Pressure of primary air at units

 $80^{\circ}C$ Hot water flow to units

temperature drop in units 10 K or as specified by manufacturer

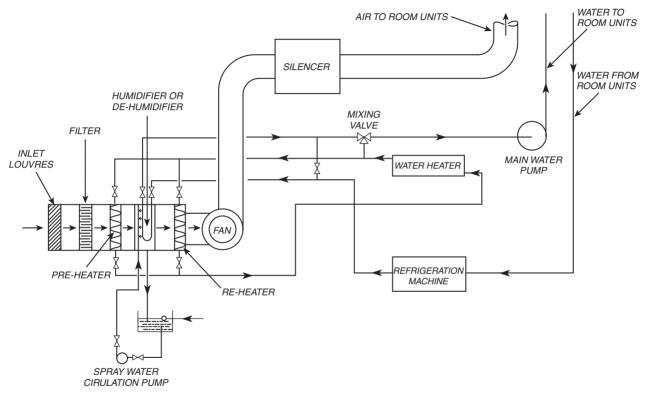

Chilled water flow to units 5-10°C but taking into account

dew point of room air

temperature rise in units 5-6 K or as specified by

manufacturer

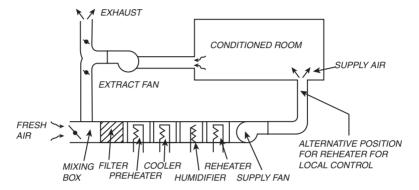

Water and air quantities and temperatures to be checked for compatibility and required outputs at both summer and winter conditions.

SCHEME OF CENTRAL PLANT FOR INDUCTION SYSTEM

#### 9 All air constant volume reheat system

Central or local plant with cooler sized for latent heat cooling load and reheater to balance for sensible heat load and for winter heating. Reheater can be remote from cooler; several reheaters can be used with one cooler to give a degree of local control. Can incorporate humidifier with preheater to give complete control of discharge air temperature and humidity.

#### Advantages

Simple.

Free cooling available at low outdoor temperatures.

Several reheat zones can be used to improve control.

Good air distribution possible because diffusers handle constant volume.

Independent control of temperature and humidity.

#### Disadvantages

Wastes energy by reheat.

Expensive in both capital and running cost.

Space occupied by air ducts.

Large volume of air to be treated in central plant.

Recirculating system necessary.

#### **Applications**

Industrial, small commercial, internal areas of large buildings, houses, apartments, shopping malls, supermarkets, large stores, restaurants, theatres, cinemas, concert halls, museums, libraries, swimming pools, sports centres, clean rooms, operating theatres, large computer installations.

**Design** parameters

0.012 m<sup>3</sup>/s per person or as needed Fresh air quantity:

for ventilation

Air velocity: as for ventilation systems, see

Chapter 11

Supply air temperature for heating: 38°C-50°C

for cooling: 6-8 K below room temperature

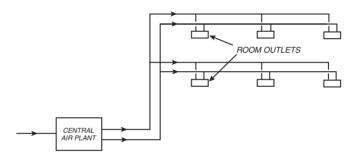

Recirculating air quantity: as required to carry heat load at spe-

cified temperature difference between

room and supply air

#### 10 Dual duct system

A central plant delivers two streams of air through two sets of ducting to mixing boxes in the various rooms. The two streams are at different temperatures.

#### Advantages

Cooling and heating available simultaneously.

Free cooling available at low outdoor temperatures.

Individual room control – zoning not necessary.

Flexible in operation.

#### Disadvantages

Two sets of supply air ducting are needed, using more space.

More air has to be treated in central plant.

Recirculation system necessary.

Expensive in both capital and running costs.

#### Applications

Hospitals, public rooms of hotels.

#### 11 Multizone units

Similar to dual duct system but mixing of air streams takes place at central plant for several building zones.

#### Advantages

Only one supply duct needed to each zone.

Free cooling available at low outdoor temperatures.

#### **Disadvantages**

Suitable only for limited number of zones.

Poor control if duties of zones differ greatly.

Recirculating system necessary.

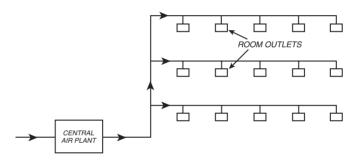

#### **Applications**

Small buildings, groups of rooms in public buildings, swimming pools, leisure centres, libraries.

#### 12 High-velocity air systems

Similar to all air systems but operate with high air velocities in supply ducts. Outlet boxes incorporate sound attenuators. Recirculation is usually at low velocity.

#### (a) Single duct

#### Advantages

Space saving through use of high velocity small diameter ducts.

Simple.

Zone control can be used.

#### **Disadvantages**

Large volume of air to be treated in central plant.

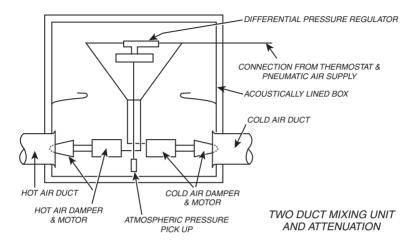

Individual room control not possible.

Recirculating system necessary – usually at low velocity.

Outlet attenuator boxes needed to overcome noise generated by high velocity ducting.

Higher fan pressure and fan power; increased running costs.

(b) Dual duct. Similar to low-velocity dual duct but with sound attenuation incorporated in outlet boxes.

#### Advantages

Space saving through use of high-velocity small diameter ducts.

Individual room control – zoning not necessary.

Flexible in operation.

Can handle larger air volumes than single duct.

#### Disadvantages

Two sets of supply air ducting are needed, using more space.

More air has to be treated in central plant.

Recirculating system necessary – usually at low velocity.

Outlet boxes must include attenuators to overcome noise generated in high-velocity ducting.

Higher fan pressure and fan power increase running costs.

#### Applications

Offices, public rooms of hotels, internal areas of large buildings.

#### Design parameters for single and dual duct high-velocity systems

Air velocities in ducts: 15-20 m/s $100-250 \text{ N/m}^2$ Pressure at inlet to furthest unit:  $1250-1500 \text{ N/m}^2$ Typical pressure at fan:

Air quantities and temperatures: as for low-velocity systems.

#### 13 Variable air volume system

An all air system in which local control is obtained by varying volume discharged at each diffuser or group of diffusers in response to the dictates of a local thermostat. Capacity of supply and extract fans is reduced as total system volume requirement falls at part load. Fans controlled by:

- (a) Variable speed.
- (b) Variable blade pitch.
- (c) Variable inlet guide vanes.
- (d) Disc throttle on fan outlet.

Satisfactory operation is critically dependent on the design and performance of the terminal diffuser units. Manufacturer's data must be adhered to.

#### Advantages

Efficient part load operation.

Individual room or area control.

Unoccupied areas can be closed off with dampers.

#### Disadvantages

Special provision needed for heating.

Extra controls needed to maintain minimum fresh air supply to terminals operating at low load.

Complexity of controls.

Cannot provide full control of humidity.

#### Methods of providing heating

(a) Perimeter heating with VAV cooling only to core of building

Simple.

Running cost uneconomic.

Controls may cause perimeter heating to add unnecessarily to cooling load.

(b) Dual-duct system

Expensive in capital cost.

Complicated and difficult to control.

Two sets of supply air ducting, using more space.

(c) Reheater in each terminal unit

Simple and effective.

Reheating cooled air reduces the economic operation which is chief attraction of variable air volume.

#### **Applications**

Offices, hospitals, libraries, large stores, schools.

#### Design parameters

Air velocities in ducts 10-15ms

Supply air temperature for cooling 9-11 K below room temperature

for heating max 35°C

Throw and spacing of units in accordance with manufacturer's

recommendations

Turn down ratio as advised by manufacturer 30%-20%

can be achieved.

#### 14 Displacement ventilation

Cooled air is introduced at low level at low outlet velocity. It spreads across the room at floor level and is drawn in to feed plumes of warmed air rising from occupants and equipment heat sources. It is extracted at high level. Low level inlets may be on walls or columns or grilles in a false floor.

#### Advantages

Removal of contaminants at source by rising plumes gives better room air quality.

Higher supply air temperature requires less refrigeration.

Simple plant and ductwork layout.

#### Disadvantages

Separate provision needed for heating, usually perimeter heating.

Possibility of draughts at ankle level near outlets.

Repositioning of outlets if partitioning or furniture layout is changed.

#### **Applications**

Industrial, commercial, offices, theatres, cinemas.

#### Design parameters

Supply temperature: 2-3 K below room temperature

Discharge velocity: 0.1-0.3 m/s

Outlets to be selected in accordance with manufacturer's data.

#### 15 Chilled ceiling

Cool water is circulated through panels in the ceiling or through beams which may be exposed or recessed. Panels in the ceiling cool occupants by radiation from occupants to cool surface. Chilled beams have a radiant effect but also cool rising warm air and produce a convective downflow of cool air. This enables beams to have a greater cooling effect than ceiling panels.

#### Advantages

Cooled rather than chilled water requires less refrigeration.

Ventilation needed only for fresh air supply, therefore smaller volume.

Takes up no floor space.

Cooling by radiation permits higher room air temperature.

Low maintenance.

#### Disadvantages

Risk of condensation at cold surface requires control of room humidity.

Insulation needed on top of ceiling panels and beams.

Other provision needed for heating, usually perimeter heating.

#### **Applications**

Offices, public buildings.

#### **Design parameters**

Water flow temperature:  $14-15^{\circ}$ C Water temperature rise: 2-3 K

Cooling effect: 30-80 W/m<sup>2</sup> floor area

Temperature difference, room to ceiling

surface: 4-8 K

Temperature difference, water to ceiling

surface: 2-3 K

Actual data to be agreed with ceiling or beam manufacturer according to application.

#### 16 Variable refrigerant volume

Similar to split direct expansion system but several indoor units are connected by a common system of refrigerant piping to one outdoor unit. Local control is obtained by varying the flow of refrigerant at each indoor unit. Compressor output is reduced as total system requirement falls at part load. A heat recovery version is possible in which hot refrigerant from units which are cooling is passed to units which are heating.

Design in accordance with manufacturer's data

#### Advantages

Efficient part load operation. Individual room or area control.

#### **Disadvantages**

Separate provision may be needed for heating. Restriction imposed by design of refrigerant piping. Limited fresh air supply.

#### **Applications**

Offices

#### Ice storage

Ice is made when electric power for refrigeration is available at a low off-peak rate. Stored ice is used to chill water for air conditioning during peak times. The store can be used for whole or part of load. A store used for part load only reduces peak demand for refrigeration and allows smaller chillers to be used, running for longer at their full load and optimum efficiency.

#### Direct system

Direct heat exchange between refrigerant and ice/water. Water alone used in secondary circuit.

Freezing and melting circuits separate.

Advantage: easier to maintain low chilled water temperature.

Disadvantage: refrigerant evaporator within ice store limits distance between store and chiller.

#### Indirect system

Intermediate circuit between refrigerant and ice/water.

Same circuit used for both freezing and melting. Intermediate circuit must contain anti-freeze.

Advantage: no restriction on distance between ice store and chiller.

Disadvantages: changeover valves needed.

Concentration of anti-freeze must be maintained.

#### Ice stores

Ice builder - refrigerant evaporator within tank of water. Ice builds on evaporator coils. Store discharged by water circulated through tank.

Ice bank – glycol mixture circulated through coil below 0°C for freezing and above 0°C for melting. No circulation through tank itself.

#### **Equipment**

To be selected from manufacturers' data.

Refrigerant evaporator must operate at lower temperature than for normal air conditioning.

#### Capacity

$$S = rac{p \sum h}{\eta}$$
  $R = H - rac{S}{n_1}$  or  $rac{S}{n_2}$ 

#### where

S = stored energy (kWhr)

p = proportion of cooling demand over cycle to be stored (= 1 for full storage)

h = load during an hour of cycle (kWhr)

 $\eta = \text{efficiency of store (normally about 0.94)}$ 

R = chiller capacity (kW)

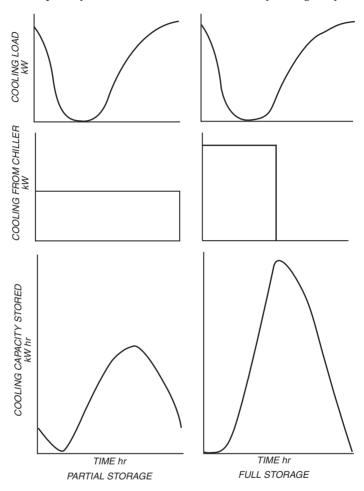

H = peak cooling load (kW)

 $n_1 = \text{time during which cooling is required (hr)}$ 

 $n_2 = \text{charging period (hr)}$ 

#### Controls

Output regulated by variation of flow of chilled water through store. Detection of quantity of ice in store can be used to vary timing of cycle.

ICE STORAGE

## Properties of refrigerants

Under European legislation the use of chlorofluorocarbons is banned from 31<sup>st</sup> December 2000. The use of hydrochlorofluorocarbons is being phased out and will be banned from 1<sup>st</sup> January 2010.

The following table gives the characteristics of new and replacement refrigerants.

Refrigerant	Formula	Boiling temp. $^{\circ}C$	$Critical$ $temp.$ $^{\circ}C$	Properties	Applications
Ammonia	$\mathrm{NH_3}$	-33	133	Penetrating odour, soluble in water, harmless in concentrations up to 0.33%, non-flammable, explosive, zero ozone depletion Low global warming potential	Large industrial plants
Lithium Bromide	LiBr	-	-	Soluble in alcohol and ether Soluble in water Zero ozone depletion Low global warming potential	Solvent for water in absorption systems
R134a	CF <sub>3</sub> CH <sub>2</sub> F	-26	101	Zero ozone depletion	Air conditioning Industrial refrigeration Domestic refrigeration Replacement for R12
R404A	CF <sub>3</sub> CHF <sub>2</sub> (44%) CF <sub>3</sub> CH <sub>3</sub> (52%) CF <sub>3</sub> CH <sub>2</sub> F (4%)	-46	72	Zero ozone depletion Non flammable Low toxicity	Cold stores and refrigerated display cabinets Replacement for R502
R407A	CH <sub>2</sub> F <sub>2</sub> (20%) CHF <sub>2</sub> CF <sub>3</sub> (40%) CF <sub>3</sub> CH <sub>2</sub> F (40%)	-42	83	Zero ozone depletion Non flammable Low toxicity	Low temperature applications Replacement for R502

## Properties of refrigerants (continued)

Refrigerant	Formula	Boiling temp. $^{\circ}C$	$Critical$ $temp.$ $^{\circ}C$	Properties	Applications
R407C	CH <sub>2</sub> F <sub>2</sub> (23%) CHF <sub>2</sub> CF <sub>3</sub> (25%) CF <sub>3</sub> CH <sub>2</sub> F (52%)	-43	87	Zero ozone depletion Non flammable Low toxicity	Air conditioning Heat pumps Replacement for R22
R410A	CH <sub>2</sub> F <sub>2</sub> (50%) CF <sub>3</sub> CHF <sub>2</sub> (50%)	-52	72	Zero ozone depletion Non flammable Low toxicity Non corrosive	Air conditioning units Heat pumps Cold stores Industrial and commercial refrigeration
R507	CF <sub>3</sub> CHF <sub>2</sub> (50%) CF <sub>3</sub> CH <sub>3</sub> (50%)	-47	71	Zero ozone depletion Low toxicity Non corrosive	Low and medium temperature applications Refrigerated display cases Replacement for R502
CARE 40 (R290) Propane	$\mathrm{CH_{3}CH_{2}CH_{3}}$	-42	97	Zero ozone depletion Low global warming potential Flammable Non toxic	Commercial and industrial refrigeration  Air conditioning  Heat pumps  Alternative to R22  and R502
CARE 50 (R170)	CH <sub>3</sub> CH <sub>2</sub> CH <sub>3</sub> CH <sub>3</sub> CH <sub>3</sub>	-49	79	Zero ozone depletion Low global warming potential Flammable Non toxic	Commercial and process refrigeration  Air conditioning Heat pumps Alternative to R22 and R502
CARE 10 (R600a) Isobutane	CH(CH <sub>3</sub> ) <sub>3</sub>	-12	135	Zero ozone depletion Low global warming potential Flammable Non toxic	Small charge hermetic applications  Domestic refrigeration
CARE 30	CH(CH <sub>3</sub> ) <sub>3</sub> CH <sub>3</sub> CH <sub>2</sub> CH <sub>3</sub>	-32	106	Zero ozone depletion Low global warming potential Flammable Non toxic	Chilled food display cabinets  Drinking water dispensers Alternative to R12

CARE is a trademark of Calor Gas Ltd

## Former refrigerants

For reference and comparison the properties of previously common refrigerants which are now either obsolete or obsolescent are listed below.

Refrigerant	Formula	$Boiling \ temp. \ ^{\circ}C$	$Critical \ temp. \ ^{\circ}C$	Properties	Applications
R12	CCl <sub>2</sub> F <sub>2</sub>	-30	112	Non flammable Non corrosive Stable	Small plants with reciprocating compressors
R11	$\mathrm{CCl_3F}$	9	198	Non flammable Non corrosive Stable	Commercial plants with centrifugal compressors
R22	CHClF <sub>2</sub>	-41	96	Non flammable Non toxic Non corrosive Stable	Packaged air conditioning units
R500	CCl <sub>2</sub> F <sub>2</sub> (74%) CH <sub>3</sub> CHF <sub>2</sub> (25%)	-33		Non flammable Non corrosive Stable	Approximately 20% more refrigeration capacity than R12. Useful when machine designed for 60 Hz had to operate on 50 Hz
R502	CHClF <sub>2</sub> (50%) CClF <sub>2</sub> CF <sub>3</sub>	-46	90	Non flamable Non toxic Non corrosive	Low temperature applications

## Friction loss through fittings

The following table takes into account static regain.  $\mathrm{EL} = \mathrm{Equivalent}$  length of pipe.

#### Air curtains

Heated air is blown across a door opening to prevent or reduce ingress of cold atmospheric air.

#### **Applications**

Door-less shop fronts.

Workshop entrances.

Doors of public buildings which are frequently opened.

#### **Temperatures**

 $35-50^{\circ}C$ Discharge Temperature: for small installation

> $25 - 35^{\circ}C$ for large installation Suction Temperature 5-15°C

#### Air velocity

Flow from above 5-15 m/s2-4 m/sbelow side 10-15 m/s

#### Air quantity:

Quantity required depends on too many variable factors for exact calculation to be possible. The quantity should be made as large as possible consistent with practicable heat requirements. Suggested values: 2000-5000 m<sup>3</sup>/m<sup>2</sup> hr of door opening. In very exposed situations or other difficult cases this can be increased to  $10\,000~\text{m}^3/\text{m}^2$  hr.

Let  $V_o =$  quantity of air entering in absence of curtain

V = quantity blown by curtain

 $V = 0.45 \ V_{\odot}$ For one-sided curtain For two-sided curtain  $V = 0.9 \ V_{\odot}$ 

Example: Width of door 4 m. Height of door 2 m. Speed of outdoor air 2 m/s.

$$V_0 = 4 \times 2 \times 2 = 16 \text{ m}^3/\text{s}$$
  
 $V = 0.45 \times 16 = 7.2 \text{ m}^3/\text{s}$ 

Discharge velocity, say 10 m/s.

$$\therefore$$
 Grille area =  $\frac{7.2}{10}$  = 0.72 m<sup>2</sup>

Height of grille = height of door = 2 m.

... Width of grille 
$$=\frac{0.72}{2} = 0.36 \text{ m}$$

# 13 Pumps and fans

## Flow in pipes

Bernoulli's Equation can be applied between points in a pipe through which fluid is flowing, with the addition of a term to allow for energy lost from the fluid in overcoming friction.

$$egin{aligned} rac{p_1}{arrho g} + rac{U_1^2}{2g} + z_1 &= rac{p_2}{arrho g} + rac{U_2^2}{2g} + z_2 + h_\mathrm{f} \ h_\mathrm{f} &= rac{p_\mathrm{f}}{arrho g} \end{aligned}$$

#### where

Subscript 1 refers to values at point 1. Subscript 2 refers to values at point 2.

 $p = \text{pressure (N/m}^2)$ 

 $\varrho = \text{density (kg/m}^3)$ 

g = weight per unit mass

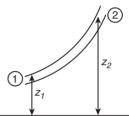

= acceleration due to gravity  $(m/s^2)$ 

U = velocity (m/s)

z = height above arbitrary datum (m)

 $h_{\rm f} = {\rm friction\ head\ from\ point\ 1\ to\ point\ 2\ (m)}$ 

 $p_{\rm f}\!=\!{\rm pressure}$  necessary to overcome friction between points 1 and 2 (N/m²)

### Fluid statics

For a liquid in equilibrium

$$p + \varrho gz = \text{const.}$$

If the datum from which z is measured is taken as the free surface of the liquid

$$z = -h$$

and

$$p=\varrho gh$$
 
$$\frac{p}{\varrho g}=h \ {
m and \ is \ termed} \ pressure \ head}$$
 
$$\frac{p}{\varrho g}+z={
m const.} \ {
m and \ is \ termed} \ piezometric \ head}$$

where

 $p = \text{pressure of liquid (N/m}^2)$   $\varrho = \text{density (kg/m}^3)$  g = weight per unit mass  $= \text{acceleration due to gravity (m/s}^2)$  z = height above arbitrary datum (m)h = depth below free surface (m)

## Fluid motion

The total energy per unit weight of a liquid in steady flow remains constant. This is expressed in *Bernoulli's Equation*:

$$\frac{p}{\rho} + \frac{U^2}{2} + gz = \text{const.}$$

or

$$\frac{p}{\rho g} + \frac{U^2}{2g} + z = \text{const.}$$

 $p/\varrho g$  is the pressure head per unit weight of fluid.

 $U^2/2g$  is the velocity head per unit weight of fluid.

z is the gravitational head above datum per unit weight of fluid.

where

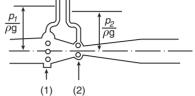

U = velocity of fluid (m/s).

Other symbols as above.

#### Venturimeter

A venturimeter is inserted in a pipe to measure the quantity of water flowing through it.

$$Q = \frac{C_{\mathrm{d}}A_2}{\sqrt{1-\left(A_2/A_1\right)^2}}\sqrt{2\binom{p_1-p_2}{\varrho}}$$

where

 $Q = \text{quantity of water flowing (m}^3/\text{s)}$ 

 $C_{\rm d} = {\rm coefficient~of~discharge}$ 

= 0.96 to 0.99

 $A = area (m^2)$ 

 $p = \text{pressure (N/m}^2)$ 

 $\rho = \text{density (kg/m}^3)$ 

Subscripts 1 and 2 refer to values of sections 1 and 2 respectively.

## Discharge of water through small orifice

$$Q = va_{
m o}$$
 $v = C_{
m v}\sqrt{2gh}$ 
 $a_{
m o} = C_{
m c}a_{
m 1}$ 

$$a_{
m o} = C_{
m c} a_1 \ Q = C_{
m v} C_{
m c} a_1 \sqrt{2gh}$$

where

 $Q = \text{quantity of water discharged (m}^3/\text{s)}$ 

v = velocity at section of minimum area of jet (m/s)

 $a_0$  = area at section of minimum area of jet (m<sup>2</sup>)

 $a_1 = \text{area of orifice (m}^2)$ 

h = height of free surface above orifice (m)

g = weight per unit mass

= acceleration due to gravity (m/s<sup>2</sup>)

 $C_{\rm v} = {\rm coefficient}$  of velocity

 $= \frac{\text{actual velocity}}{\text{theoretical velocity}} = 0.96 \text{ to } 0.99$ 

 $C_{
m c} = {
m coefficient}$  of contraction

 $= a_{\rm o}/a_1 = 0.6$  to 0.7

## Velocity heads and theoretical velocities of water

$$h = rac{v^2}{2g}$$
  $h = {
m Head\ in\ m} \ v = {
m Velocity\ in\ m/s} \ g = {
m Gravity\ of\ earth} = 9.81\ {
m m/s}^2$

### Centrifugal pumps

The action of pumps is most conveniently expressed in terms of head. The rotor gives the liquid a head.

#### Notation

 $v_1 =$  absolute velocity of water at inlet (m/s)  $v_2$  = absolute velocity of water at outlet (m/s)  $U_1$  = tangential velocity of blade at inlet (m/s)  $U_2$  = tangential velocity of blade at outlet (m/s)  $V_{\rm w1}$  = tangential velocity of water at inlet (m/s)  $V_{\rm w2}$  = tangential velocity of water at outlet (m/s)  $R_1$  = velocity of water relative to blade at inlet (m/s)  $R_2$  = velocity of water relative to blade at outlet (m/s)  $g = \text{weight per unit mass} = 9.81 \text{ (m/s}^2\text{)}$  $\rho = \text{density (kg/m}^3)$  $p_1 = \text{pressure of water at inlet (N/m}^2)$  $p_2 = pressure of water at outlet (N/m<sup>2</sup>)$  $H_{\rm i}\!=\!{\rm ideal}$  head developed by pump (m)  $H_a = \text{manometric head}$ = actual head developed by pump (m)  $\eta_{\rm m} = {\rm manometric\ efficiency\ (\%)}$  $\eta_0$  = overall efficiency (%)

Normally for a pump  $V_{\rm w1} = 0$ 

Then

$$H_{\mathrm{i}}\!=\!\mathrm{work}$$
 done on water per unit weight  $=\!\frac{U_{2}V_{\mathrm{w}2}}{g}$ 

When the output of a pump is expressed as head of working liquid it is independent of the density of the liquid.

$$H_{\mathrm{m}}=rac{p_{2}-p_{1}}{arrho g}+rac{v_{2}^{2}}{2g}$$

Actual head is less than ideal because of friction losses within pump.

$$\eta_{
m m} = rac{H_{
m m}}{H_{
m i}} imes 100$$

Overall efficiency is lower again because of mechanical losses in bearings, etc.

$$\eta_{
m o} = rac{H_{
m m}Qarrho g}{S} imes 100$$

where

Q = quantity of water flowing (m<sup>3</sup>/s) S = power input at shaft (Nm/s)

The specific speed of a centrifugal pump is the speed at which the pump would deliver 1 m<sup>3</sup>/s of water at a head of 1 m.

$$N_{
m s} = rac{nQ^{1/2}}{H^{3/4}}$$

where

 $N_s = \text{specific speed}$ 

n = speed (rev/min)

 $Q = \text{volume delivered (m}^3/\text{s})$ 

H = total head developed (m)

#### Pump laws

1 Volume delivered varies directly as speed

$$\frac{Q_1}{Q_2} = \frac{N_1}{N_2}$$

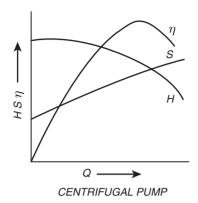

2 Head developed varies as the square of speed

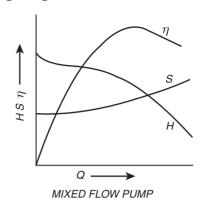

$$rac{H_1}{H_2}=\left(rac{N_1}{N_2}
ight)^2$$

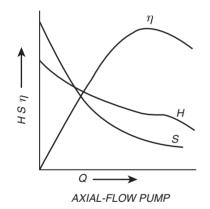

3 Power absorbed varies as the cube of speed

$$rac{S_1}{S_2} = \left(rac{N_1}{N_2}
ight)^3$$

## Characteristic curves of pumps

Q = QUANTITY FLOWING	(m³/s)
H = HEAD DEVELOPED	(m)
S = POWER ABSORBED	(W)
$\eta = EFFICIENCY$	(%)

A centrifugal pump takes the least power when the flow is zero. It should therefore be started with the delivery valve shut.

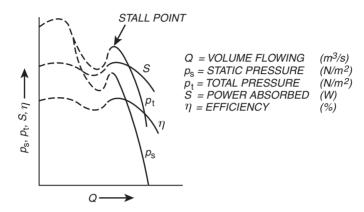

An axial flow pump takes the least power when the flow is greatest. It should therefore be started with the delivery valve open.

#### **Fans**

#### 1 Propeller fans and axial flow fans

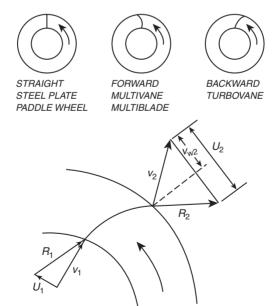

Pressure for single stage up to about  $300~\text{N/m}^2$ . Suitable for large volumes at comparatively low pressures.

#### Characteristic curve for axial flow fan

#### 2 Centrifugal fans

Types of blade

#### Notation

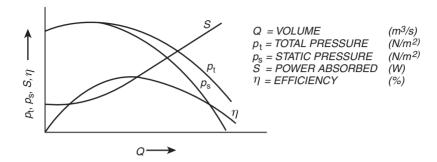

Suffix 1 refers to inlet.

Suffix 2 refers to outlet. v = absolute velocity of air (m/s) u = tangential velocity of blade (m/s) $v_{\rm w}$  = tangential velocity of air (m/s) R = velocity of air relative to blade (m/s)g = weight per unit mass  $=9.81 \text{ (m/s}^2)$  $\varrho = \text{density of air (kg/m}^3)$  $p_{\rm t} = \text{total pressure (N/m}^2)$  $p_{\rm s} = {\rm static\ pressure\ (N/m^2)}$  $p_i$  = theoretical total pressure developed by fan (N/m<sup>2</sup>)  $p_a$  = actual total pressure developed by fan (N/m<sup>2</sup>)  $\hat{Q} = \text{volume of air (m}^3/\text{s)}$ S =power input to fan (W)  $\eta = \text{efficiency (\%)}$ 

#### Normally

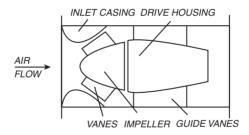

$$\begin{split} p_{\rm i} &= U_2 v_{\rm w2} \varrho \qquad v_{\rm w1} = 0 \\ p_{\rm t} &= p_{\rm s} + \frac{v^2 \varrho}{2} \\ p_{\rm a} &= p_{\rm t2} - p_{\rm t1} = p_{\rm s2} - p_{\rm s1} + \frac{\left(v_2^2 - v_1^2\right) \varrho}{2} \\ \eta &= \frac{P_{\rm a} Q}{S} \times 100 \end{split}$$

## Characteristic curve for centrifugal fan

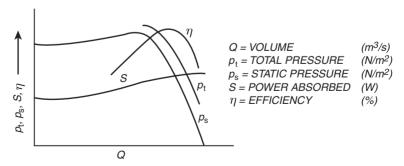

#### 3 Mixed flow fans

Within an axial casing the impeller hub and casing inlet form a conical passage in which the impeller blades combine axial and centrifugal actions. Downstream guide vanes turn the radial component of air velocity into axial velocity without loss of pressure. This enables a fan with an axial-type casing fitted in a straight run of ducting to develop higher pressures than a normal axial flow fan.

#### CHARACTERISTIC CURVE FOR MIXED FLOW FAN

#### Typical efficiencies

Small fans	0.40
Medium fans	0.60
Large fans	0.80

#### Fan laws

1 Volume varies directly as speed

$$rac{Q_1}{Q_2}=rac{N_1}{N_2}$$

Total pressure varies as the square of speed

$$rac{P_{
m t1}}{P_{
m t2}} = \left(rac{N_1}{N_2}
ight)^2$$

Power absorbed varies as the cube of speed

$$rac{S_1}{S_2} = \left(rac{N_1}{N_2}
ight)^3$$

### Selection of fans

- 1 Air volume to be moved.
- Static pressure or resistance.
- Noise level permissible.
- Electric supply available.

## Pressures commonly used for typical systems

Public buildings, ventilation only	$90-150 \; \text{N/m}^2$
Public buildings, combined heating and ventilation	$150-250 \text{ N/m}^2$
Public buildings, combined heating and ventilation with air	
cleaning plant	$170 - 300 \text{ N/m}^2$
Factories, heating only	$170-400 \text{ N/m}^2$
Factories, combined heating and ventilation	$300-500 \text{ N/m}^2$

## Fan discharge velocities for quiet operation

	Supply systems m/s	Extract systems m/s
Sound studios, churches, libraries	4-5	5-7
Cinemas, theatres, ballrooms	5-7.5	6-8
Restaurants, offices, hotels, shops	6-8	7-9

# **14** Sound

## Sound. (Energy travelling as a pressure wave)

One decibel is equal to ten times the logarithm to base 10 of the ratio of two quantities.

$$I = \frac{W}{A} = \frac{p^2}{\varrho c}$$

Sound power level

$$PWL = 10 \log_{10} \frac{W}{W_0}$$

Sound intensity

$$IL = 10 \log_{10} \frac{I}{I_o}$$

Sound pressure level

$$SPL = 10 \log_{10} \frac{p^2}{p_0^2}$$
  
=  $20 \log_{10} \frac{p}{p_0}$ 

where

 $I = \text{intensity of sound (W/m}^2)$   $I_o = \text{reference intensity (W/m}^2)$  W = power (W)  $W_o = \text{reference power (W)}$   $A = \text{area (m}^2)$   $p = \text{root mean square pressure (N/m}^2)$   $p = \text{reference pressure (N/m}^2)$   $p = \text{density (kg/m}^3)$   $p = \text{density (kg/m}^3)$  p = density of sound (m/s)

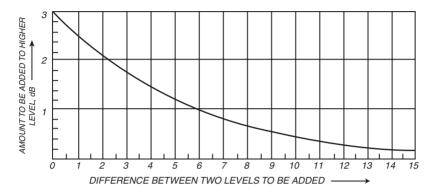

The usual reference levels are

$$\begin{array}{l} W_{\rm o} = 10^{-12} \ {\rm watts} \\ I_{\rm o} = 10^{-12} \ {\rm W/m^2} \\ p_{\rm o} = 0.0002 \ {\rm \mu bar} = 20 {\times} 10^{-6} \ {\rm N/m^2} \end{array}$$

At room temperature and at sea level SPL = IL + 0.2 decibels

## Measurement of noise

## Method of adding levels expressed in decibels

Noise rating Graphs are plotted of Sound Pressure Level (SPL) v frequency, to show how the acceptable sound level varies with frequency. What is acceptable depends on the use to which the room will be put, and so a different curve is obtained for each type of use. Each such curve is designated by an NR number.

NR No.	Application
NR 25	Concert halls, broadcasting and recording studios, churches
NR 30	Private dwellings, hospitals, theatres, cinemas, conference rooms
NR 35	Libraries, museums, court rooms, schools, hospital operating theatres and wards, flats, hotels, executive offices
NR 40	Halls, corridors, cloakrooms, restaurants, night clubs, offices, shops
NR 45	Department stores, supermarkets, canteens, general offices
NR 50	Typing pools, offices with business machines
NR 60	Light engineering works
NR 70	Foundries, heavy engineering works

## NR levels (SPL. dB re 0.00002 N/m<sup>2</sup>)

Noise rating	Octave band mid-frequency, HZ							
	62.5	125	250	500	1000	2000	4000	8000
NR10	42	32	23	15	10	7	3	2
NR20	51	39	31	24	20	17	14	13
NR30	59	48	40	34	30	27	25	23
NR35	63	52	45	39	35	32	30	28
NR40	67	57	49	44	40	37	35	33
NR45	71	61	54	48	45	42	40	38
NR50	75	65	59	53	50	47	45	43
NR55	79	70	63	58	55	52	50	49
NR60	83	74	68	63	60	57	55	54
NR65	87	78	72	68	65	62	61	59
NR70	91	83	77	73	70	68	66	64
NR75	95	87	82	78	75	73	71	69
NR80	99	91	86	82	80	78	76	74

Sound obeys the Inverse Square Law

$$p^2 = K \frac{W}{r^2}$$

where

p = root mean square pressure

K = constant

W = power

r =distance from source

or

$$SPL = PWL - 20 \log_{10} r + K'$$
  
 $K' = \log_{10} K = constant.$ 

In air with source near ground, K' = -8.

For a continuing source in a room, the sound level is the sum of the direct and the reverberant sound and is given by

$$\mathrm{SPL} = \mathrm{PWL} + 10\,\log_{10}\left[\frac{Q}{4\pi r^2} + \frac{4}{R}\right]\mathrm{dB}$$

where

$$Q = \frac{\text{SPL at distance } r \text{ from actual source}}{\text{SPL at distance } r \text{ from uniform source of same power}}$$

$$R = \text{Room constant} = \frac{S\alpha}{1-\alpha} \text{ m}^2$$

 $S = \text{Total surface area of room m}^2$ 

 $\alpha =$  Absorption coefficient of walls

r in m

## Coefficient of absorption $\alpha$

For range of frequencies usual in ventilation applications

Plaster walls Unpainted brickwork Painted brickwork	0.01-0.03 $0.02-0.05$ $0.01-0.02$	25 mm wood wool cement on battens 50 mm slag wool or glass silk	0.6-0.7 0.8-0.9
3-plywood panel	0.01-0.02	12 mm acoustic belt	0.5-0.6
6 mm cork sheet	0.1 - 0.2	Hardwood	0.3
6 mm porous rubber sheet	0.1 - 0.2	25 mm sprayed asbestos	0.6 - 0.7
12 mm fibreboard on		Persons, each	2.0-5.0
battens	0.3 - 0.4	Acoustic tiles	0.4-0.8

## Sound insulation of walls

Transmission coefficient  $\tau = \frac{\text{transmitted energy}}{\text{incident energy}}$ 

#### Sound reduction index

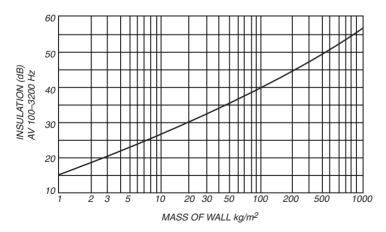

$$SRI = 10 \ log_{10} \bigg(\frac{1}{\tau}\bigg) dB$$

Empirical formula is

$$SRI = 15 \log(\sigma f) - 17$$

where

 $\sigma = \text{mass per unit area of wall (kg/m}^2)$ f = frequency (Hz)

SOUND INSULATION OF SOLID WALLS ACCORDING TO MASS

#### Transmission through walls

$$(\mathit{SPL})_1 - (\mathit{SPL})_2 = \mathit{SRI} - 10 \, \log_{10} \biggl( \frac{S_p}{S_2 \alpha_2} \biggr) \mathrm{dB}$$

where

 $(SPL)_1 =$ sound pressure in sending room

 $(SPL)_2$  = sound pressure in receiving room

SRI = sound reduction index

 $S_2\alpha_2$  = equivalent absorption in receiving room

 $S_{\rm p}$  = area of partition wall

## Sound insulation of windows

Single/ double window	Type of window	Type of glass	Sound reduction in dB
Single	Opening type (closed)	Any glass	18-20
Single	Fixed or opening type with air-tight weather strips	24/32 oz sheet glass 6 mm polished plate glass 9 mm polished plate glass	23-25 27 30
Double	Opening type (closed) plus absorbent material on sides of air space	24/32 oz sheet glass 100 mm space 24/32 oz sheet glass 200 mm space 6 mm polished plate glass 100 mm space 6 mm polished plate glass 200 mm space	28 31 30 33
Double	Fixed or opening type with air-tight weather strips	24/32 oz sheet glass 100 mm space 24/32 oz sheet glass 200 mm space 6 mm polished plate glass 100 mm space 6 mm polished plate glass 200 mm space	34 40 38 44

## Attenuation by building structure

Structure	$\begin{array}{c} Attenuation \\ dB \end{array}$	Structure	$\begin{array}{c} Attenuation \\ dB \end{array}$
9 in brick wall	50	Double window 50 mm spacing	30
6 in (150 mm) concrete wall	42	12 mm T & G boarded partition	26
Wood joist floor and ceiling	40	2.5 mm glass window	23
Lath and plaster partition	38		

#### Transmission through ducts

$$\begin{split} \frac{\text{Attenuation}}{\text{Duct length}} &= 1.07 \alpha^{1.4} \frac{P}{A} \text{dB per ft} \\ &= 1.07 \alpha^{1.4} \frac{P}{A} \text{dB per m} \end{split}$$

where

 $\alpha = \text{coefficient of absorption}$ 

P = perimeter of duct

A =cross sectional area of duct

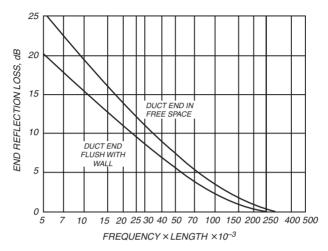

## Approximate attenuation of round bends or square bends with turning vanes in dB

Frequency	20-	75-	150-	300-	600-	1200-	2400-	4800-
Hz	75	150	300	600	1200	2400	4800	10 000
Diameter								
5 to 10 in								
125  to  250  mm	0	0	0	0	1	2	3	3
11 to 20 in								
251  to  500  mm	0	0	0	1	2	3	3	3
21 to 40 in								
501 to 1000 mm	0	0	1	2	3	3	3	3
41 to 80 in								
$1001\ to\ 2000\ mm$	0	1	2	3	3	3	3	3

## Attenuation due to changes in area in dB

Ratio of Area $S_2/S_1$	$egin{aligned} Attenuation \ dB \end{aligned}$	Ratio of Area $S_2/S_1$	$Attenuation \ dB$
1	0.0	3	1.3
2	0.5	4	1.9
2.5	0.9	5	2.6

## Attenuation at entry to room (end reflection loss)

END REFLECTION LOSS FOR RECTANGULAR OPENING LENGTH =  $\sqrt{L_1 \times L_2}$  FOR CIRCULAR OPENING LENGTH = 0.9 DIA. LENGTHS IN mm.

## Sound power level (PWL) of fans

Exact data for any particular fan is to be obtained from the manufacturer. In the absence of this the following approximate expressions may be used.

$$PWL = 90 + 10 \log_{10} s + 10 \log_{10} h$$
  
 $PWL = 55 + 10 \log_{10} q + 20 \log_{10} h$   
 $PWL = 125 + 20 \log_{10} s - 10 \log_{10} q$ 

where

s = rated motor power (hp)

h = fan static head (in water gauge)

 $q = \text{volume discharged (ft}^3/\text{min)}$ 

$$\begin{array}{l} PWL = 67 + 10\,\log_{10}S + 10\,\log_{10}p \\ PWL = 40 + 10\,\log_{10}Q + 20\,\log_{10}p \\ PWL = 94 + 20\,\log_{10}S - 10\,\log_{10}Q \end{array}$$

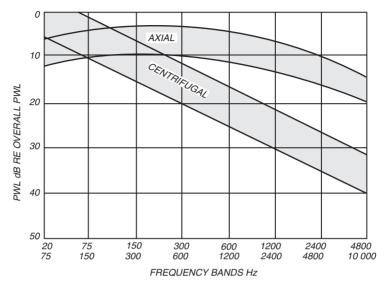

where

S = rated motor power (kW)

 $p = \text{fan static pressure (N/m}^2)$ 

 $Q = \text{volume discharged (m}^3/\text{s)}$ 

## Typical curves of fan frequency distribution

SOUND POWER LEVEL SPECTRA OF FANS

## Sound absorption

- (a) Sound absorption by increase of duct area.
- (b) Ceiling air outlet with sound-absorbing plate.
- Sound absorption in branch duct with splitter. (c)
- Arrangement of splitters in main duct. (d)

## 15 Labour rates

The following schedules give basic times for installation and erection of heating and ventilating equipment.

**Included**. Haulage of all parts into position, erection on site, surveying of builder's work, testing.

Not included. Delivery to site, travelling time, addition for overtime working.

## Additions to basic time

The basic time given should be increased

For jobs under 1 week	by 40%
For jobs under 2 weeks	20%
For jobs under 3 weeks	8%
For work in existing buildings, unoccupied	5%
For work in existing buildings, occupied	15%
For work in existing building, with concealed pipes	20%

# **Bibliography**

The following list is intended as a guide for readers who require more theoretical treatment of the topics on which data is presented in this book. It is a selection of books which are both useful and generally accessible, but does not claim to be exhaustive. Some of the books mentioned are out of print; they are included because they are available in libraries and contain material which is still useful.

#### Handbooks

CIBSE Guides. Chartered Institution of Building Services Engineers, London Handbook of Air Conditioning Design. Carrier Air Conditioning, Biggin Hill, Kent

Kempe's Engineering Yearbook, Morgan-Grampian, London

Machinery's Handbook, The Industrial Press, New York

Mark's Standard Handbook for Mechanical Engineers, McGraw-Hill, New York Newnes Mechanical Engineers Pocket Book. 2nd ed. (1997)

Powell, M.J.V., House Builder's Reference Book, Butterworth-Heinemann, Oxford (1979)

# 17 Standards

#### **British Standards**

The following list of British Standards relevant to heating ventilating and air conditioning is based on information available in March 2000. For the latest details reference should be made to the current BSI Catalogue which is published annually.

# 10: 1962 Flanges and bolting for pipes, valves and fittings (obsolescent)

Flanges in grey cast iron, copper alloy and cast or wrought steel for  $-328^{\circ}$ F ( $-200^{\circ}$ C) to  $975^{\circ}$ F ( $524^{\circ}$ C) and up to 2800 lb/in<sup>2</sup>. Materials and dimensions of flanges, bolts and nuts. Ten tables cover plain, boss, integrally cast or forged, and welding neck types.

# 21: 1985 Pipe threads for tubes and fittings where pressure-tight joints are made on the threads (metric dimensions)

Range of threads from 1/16 to 6, together with thread forms, dimensions, tolerances, and designations. Requirements for jointing threads for taper external threads, for assembly with either taper or parallel internal threads and for longscrews specified in BS 1387.

# 41: 1973 (1998) Cast iron spigot and socket flue or smoke pipes and fittings

Material, dimensions and tolerances of pipes, bends and offsets up to 300 mm nominal bore and nominal weight of pipes.

# 143 & 1256: 1986 Malleable cast iron and cast copper alloy threaded pipe fittings

Requirements for design and performance of pipe fittings for design to BS 143 having taper external and internal threads and BS 1256 having taper external and parallel internal threads.

# 417: -- Galvanised low carbon steel cisterns, cistern lids, tanks and cylinders

#### 417: Part 1: 1964 Imperial units (obsolescent)

Cold and hot water storage vessels for domestic purposes.

Cisterns: 20 sizes from 4 to 740 gallons capacity, in two grades.

Tanks: 5 sizes from 31 to 34 gallons capacity, in two grades.

Cylinders: 10 sizes from 16 to 97 gallons capacity, in two grades.

#### 417: Part 2: 1987 Metric units

Capacities from  $18\ l$  to  $3364\ l$  for cisterns, 95 to  $115\ l$  for tanks, 73 to  $441\ l$  for cylinders.

#### 499: -- Welding terms and symbols

#### 499: Part 1: 1991 Glossary for welding, brazing and thermal cutting

Gives terms common to more than one process, terms relating to welding with pressure, fusion welding, brazing, testing, weld imperfections and thermal cutting.

#### 499: Part 1: 1992 Supplement

Definitions for electric welding equipment.

#### 499: Part 2c: 1980 Welding symbols

Provides, in chart form, the type, position and method of representation of welding symbols and examples of their use.

#### 567: 1973 (1989) Asbestos - cement flue pipes and fittings, light quality

Diameters 50 to 150 mm, for use with gas-fired appliances up to 45 kW.

#### 599: 1966 Methods of testing pumps

Testing performance and efficiency of pumps for fluids which behave as homogeneous liquids.

#### 699: 1984 (1990) Copper direct cylinders for domestic purposes

Requirements for copper direct cylinders, with capacities between 74 and 450 litres, for storage of hot water. Covers 4 grades and 16 sizes and also factory-applied insulation and protector rods.

#### 715: 1993 Metal flue pipes, fittings, terminals and accessories for gas-fired appliances with a rated input not exceeding 60 kW

#### 749: 1969 Underfeed stokers

Stokers rated up to 550 kg of coal per hour for all furnaces except metallurgical or other high temperature; requirements, installation, maintenance.

#### 759: -- Valves, gauges and other safety fittings for application to boilers and to piping installations for and in connection with **boilers**

#### 759: Part 1: 1984 Valves, mountings and fittings for boilers

Requirements for safety fittings excluding safety valves for boiler installations where steam pressure exceeds 1 bar gauge or, in the case of hot water boilers, the rating is 44 kW and above.

#### 779: 1989 Cast iron boilers for central heating and indirect water supply (rated output 44 kW and above)

Design and construction including materials, workmanship, inspection, testing and marking of boilers for use with solid, gaseous and liquid fuels.

#### 799: -- Oil burning equipment

#### 799: Part 2: 1991 Vaporising burners

Requirements for oil vaporising burners and associated equipment for boilers, heaters, furnaces, ovens and similar static flued plant such as free standing space-heating appliances, for single family dwellings.

#### 799: Part 3: 1981 Automatic and semi-automatic atomising burners up to 36 litres per hour

Requirements for materials for all component parts and such parts of component design and plant layout as are fundamental to the proper functioning of such equipment.

#### 799: Part 4: 1991 Atomising burners (other than monobloc type) together with associated equipment for single burner and multi-burner installations

For land and marine purposes. Suitable for liquid fuels to BS 2869 and BS 1469.

#### 799: Part 5: 1989 Oil storage tanks

Requirements for carbon steel tanks for the storage of liquid fuel used in conjunction with oil-burning equipment. Includes integral tanks which form part of a complete oil-fired unit, service tanks, and storage tanks with a maximum height of 10 m and capacities up to 150 000 l.

#### 799: Part 7: 1988 Dimensions of atomising oil-burner pumps with rotating shaft and external drive

Fixes the dimensions for connectors and certain dimensional characteristics of pumps.

#### 799: Part 8: 1988 Connecting dimensions between atomising oil burners and heat generators

Applicable to atomising oil burners up to 150 kW capacity.

#### 835: 1973 (1989) Asbestos cement flue pipes and fittings, heavy quality

Diameters from 75 to 600 mm for use with solid fuel and oil-burning appliances of output rating not exceeding 45 kW, for gas-fired appliances and for incinerators not exceeding 0.09 m<sup>3</sup> capacity.

#### 845: -- Methods of assessing thermal performance of boilers for steam hot water and high temperature heat transfer fluids

#### 845: Part 1: 1987 Concise procedure

A concise but complete test method, at minimum cost, for assessing the thermal performance of boilers, generally at output greater than 44 kW, which are thermodynamically simple and fired by solid, liquid or gaseous fuels.

#### 845: Part 2: 1987 Comprehensive procedure

A comprehensive test method for assessing the thermal performance of any boiler, generally of output greater than 44 kW, including those

with multiple thermal flows to and from the boiler, and fired by solid. liquid or gaseous fuels.

#### 848: -- Fans for special purposes

848: Part 1: 1997 Performance testing using standardised airways

848: Part 2: 1985 Methods of noise testing

Determination of the acoustic performance of fans operating against differences of pressure. Four methods are described: in-duct, reverberant field, free field and semi-reverberant.

848: Part 4: 1997 Dimensions

848: Part 5: 1986 Guide for mechanical and electrical safety

Fans connected to single-phase a.c., three-phase a.c. and d.c. supplies up to 660 V. Identifies the circumstances in which safety measures should be taken and gives information on how safety hazards can be reduced or eliminated.

848: Part 6: 1989 Method measurement of fan vibration

#### 853: -- Vessels for use in heating systems

853: Part 1: 1996 Calorifiers and storage vessels for central heating and hot water supply

Strength and method of construction.

853: Part 2: 1996 Tubular heat exchangers and storage vessels for building and industrial services

855: 1976 Welded steel boilers for central heating and indirect hot water supply (rated output 44 kW to 3 MW)

Requirements for design and construction of boilers for use with solid, gaseous and liquid fuels.

1010: -- Draw off valves and stop valves for water services (screwdown pattern)

#### 1010: Part 2: 1973 Draw off taps and above ground stop valves

Dimensions and test requirements for screwdown pattern draw off taps and above ground stop valves 1/4 in to 2 in nominal sizes. Material, design, dimensions of components and union ends.

#### 1181: 1989 Clay flue linings and flue terminals

For use with certain domestic appliances, including gas-burning installations, and for ventilation. Dimensions, performance characteristics, sampling, testing, inspection and marking.

#### 1212: -- Float operated valves (including floats)

#### 1212: Part 1: 1990 Piston type

Seven sizes from 3/8 in to 2 in. Materials, quality, workmanship, dimensions and performance requirements.

#### 1212: Part 2: 1990 Diaphragm type (copper alloy body)

Workmanship, dimensions and performance requirements for nominal sizes 3/8 and 1/2.

# 1212: Part 3: 1990 Diaphragm type (plastics body) for cold water services

Operational requirements.

# 1339: 1965 (1981) Definitions, formulae and constants relating to the humidity of air

Includes tables of saturation vapour pressure and bibliography.

# 1387: 1985 (1990) Screwed and socketed steel tubes and tubulars and plain end steel tubes suitable for welding or for screwing to BS 21 pipe threads

Applicable to tubes of nominal sizes DN 8 to DN 150 in light, medium and heavy thicknesses.

# 1394: -- Stationary circulation pumps for heating and hot water service systems

#### 1394: Part 2: 1987 Physical and performance requirements

Physical and performance requirements for pumps with a rated input not exceeding 300 W.

#### 1415: -- Mixing valves

# 1415: Part 1: 1976 Non-thermostatic, non-compensatory mixing valves

Performance requirements, materials and methods of specification of 1/2 and 3/4 nominal size valves.

#### 1415: Part 2: 1986 Thermostatic mixing valves

Materials, designs, construction and performance requirements, with method of specifying size, for thermostatic mixing valves suitable for use with inlet supply pressures up to 6 bar and inlet water temperature between 10°C and 72°C.

#### 1564: 1975 (1983) Pressed steel sectional rectangular tanks

Working under a pressure not exceeding the static head corresponding to the depth of the tank, built up from pressed steel plates 1220 mm square. The sectional dimensions are interchangeable with the imperial dimensions of the previous standard.

#### 1565: -- Galvanised mild steel indirect cylinders

1565: Part 1: 1949 Imperial units (obsolescent)

#### 1565: Part 2: 1973 Metric units (obsolescent)

#### 1566: -- Copper indirect cylinders for domestic purposes

#### 1566: Part 1: 1984 (1990) Double feed indirect cylinders

Requirements for cylinders with capacities between 72 and 440 l for hot water storage. Covers 4 grades and 16 sizes and also includes factory-applied insulation and protector rods.

#### 1566: Part 2: 1984 Single-feed indirect cylinders

Requirement for 3 grades for cylinders with capacities from 86 to 196 l. Covers 3 grades and 7 sizes. The cylinders are of the type in which the bottom is domed inwards.

#### 1586: 1982 Methods of performance testing and presentation of performance data for refrigerant condensing units

Applies to air and water-cooled condensing units employing singlestage refrigerant compressors including hermetic, semi-hermetic and open types. Describes the method for presentation of performance data for these units including correction factors and part load characteristic where applicable.

#### 1608: 1990 Electrically-driven refrigerant condensing units

Design, construction and testing of units up to a power input of approximately 25 kW.

#### 1710: 1984 (1991) Identification of pipelines and services

Colours for identifying pipes conveying fluids in liquid or gaseous form in land and marine installations.

#### 1740: -- Wrought steel pipe fittings

#### 1740: Part 1: 1971 (1990) Metric units

Welded and seamless fittings 6 mm to 150 mm for use with steel tubes to BS 1387, screwed BSP thread to BS 21.

#### 1756: -- Methods for sampling and analysis of flue gases

#### 1756: Part 1: 1971 Methods of sampling

#### 1756: Part 2: 1971 Analysis by the Orsat apparatus

Apparatus, reagents, method, sample analysis, calculations, reporting of results.

#### 1756: Part 3: 1971 Analysis by the Haldane apparatus

Apparatus, reagents, method, sample analysis, calculation, reporting of results.

#### 1756: Part 4: 1977 Miscellaneous analyses

Determination of moisture content, sulphuric acid dew point, carbon monoxide, oxides of sulphur and oxides of nitrogen.

#### 1756: Part 5: 1971 Semi-routine analyses

Carbon dioxide, carbon monoxide and total oxides of sulphur. Mainly for combustion performance of domestic gas appliances.

#### 1894: 1992 Design and manufacture of electric boilers of welded construction

Materials, workmanship, inspection, testing, documentation and marking of boilers utilising electrodes or immersion elements to provide hot water or steam. Boilers are cylindrical constructed from carbon or carbon manganese steel by fusion welding.

#### 2051: -- Tube and pipe fittings for engineering purposes

#### 2501: Part 1: 1973 (obsolescent) Copper and copper alloys capillary and compression tube fittings for engineering purposes

Applies to capillary and compression fittings, in sizes from 4 mm to 42 mm. These fittings are intended primarily for use with tubes of the outside diameters given in BS 2871: Part 2.

#### 2740: 1969 (1991) Single smoke alarms and alarm metering devices

Requirements for the construction and operation of instruments designed to give an alarm when smoke emission from a chimney exceeds a chosen Ringelmann shade.

#### 2742: 1969 (1991) Notes on the use of the Ringelmann and miniature smoke charts

Explains the purpose and method of use of these charts for the visual assessment of the darkness of smoke emitted from chimneys.

#### 2742C: 1957 (1991) Ringelmann chart

#### 2742M: 1960 (1991) Miniature smoke chart

A chart, printed in shades of grey matt lacquer, which when held at about 5 ft from the observer gives readings of the density values of smoke from chimneys.

#### 2767: 1991 Manually operated copper alloy valves for radiators

Designation, pressure and temperature ratings, materials, design, construction and testing of manual valves. Includes handwheel torque strength test, connections for metric copper tubes, compression type tailpiece connections, plating and drainage facility.

#### 2811: 1969 (1991) Smoke density indicators and recorders

Requirements of construction and operation of instruments designed to measure the optical density of, or percentage obscuration caused by, smoke emitted from chimneys.

#### 2869: 1998 Fuel oils for agricultural, domestic and industrial engines and boilers

#### 2879: 1980 (1988) Draining taps (screw down pattern)

Specifies 1/2 and 3/4 nominal size copper alloy bodied taps for draining down hot and cold water installations and heating systems.

#### 3048: 1958 Code for the continuous sampling and automatic analysis of flue gases, indicators and recorders

Automatic instruments for direct indication or record of composition of flue gases from industrial plant. Thermal conductivity instruments,

instruments depending on chemical absorption and chemical reaction. viscosity and density instruments, oxygen meters, infra-red absorption instruments. Determination of dew point.

#### 3198: 1981 Copper hot water storage combination units for domestic purposes

Requirements for direct, double-feed indirect and single-feed indirect types of units having hot water storage capacities between 65 and 180 litres.

#### 3250: -- Methods for the thermal testing of domestic solid fuel burning appliances

3250: Part 1: (1993) Flue loss method

#### 3250: Part 2: 1961 (1988) Hood method

Describes a method in which the convection warm air from the appliance is collected by means of a hood and measured directly.

#### Kerosine (paraffin) unflued space heaters, cooking and boiling appliances for domestic use

Construction, safety, performance, marking and methods of test.

#### 3377: 1985 Boilers for use with domestic solid mineral fuel appliances

Materials, construction and pressure testing of boilers of normal and high output for use with domestic solid mineral fuel appliances.

#### 3416: 1991 Bitumen-based coatings for cold applications, suitable for use in contact with potable water

Two types each with three classes of coatings, all of which give films that comply with the national requirements for contact with potable water.

#### 3505: 1986 Unplasticised polyvinyl chloride (PVC-U) pressure pipes for cold potable water

Pipes up to and including nominal size 24 for use at pressures up to 15 bar and 20°C, such that pipes which conform to the standard will be acceptable to UK water undertakings.

#### 3974: -- Pipe supports

#### 3974: Part 1: 1974 Pipe hangers, slider and roller type supports

Requirements for the design and manufacture of components for the hanger, slide and roller type supports for uninsulated and insulated steel and cast iron pipes of nominal sizes 15 mm to 160 mm within the temperature range  $-20^{\circ}\text{C} + 470^{\circ}\text{C}$ .

#### 3974: Part 2: 1978 Pipe clamps, cages, cantilevers and attachments to beams

Applies to pipes of nominal sizes 100 mm to 600 mm.

4127: 1993 Light gauge stainless steel tubes, primarily for water applications

# 4213: 1991 Cold water storage and combined feed and expansion cistern (polyolefin or olefin copolymer) up to 500 L capacity used for domestic purposes

Requirements for materials and physical properties for cisterns for use in the storage of water.

#### 4256: -- Oil burning air heaters

#### 4256: Part 2: 1972 (1980) Fixed, flued, fan-assisted heaters

Construction, operation, performance and safety requirements for heaters, designed for use with distillate coals such as kerosene, gas oil and domestic fuel oil.

# 4433: -- Domestic solid mineral fuel fired boilers with rated outputs up to $45\ kW$

4433: Part 1: 1994 Boilers with undergrate ash removal

4433: Part 2: 1994 Gravity feed boilers designed to burn small anthracite

#### 4485: -- Water cooling towers

#### 4485: Part 2: 1988 Methods of performance testing

Determination of the performance of industrial mechanical draught and natural draught towers.

#### 4504: -- Circular flanges for pipes, valves and fittings

#### 4504: Section 3.1: 1989 Steel flanges

Types of circular steel flanges from PN 2.5 to PN 40 and in sizes up to DN 4000. Facings, dimensions, tolerances, threading, bolt sizes, marking and materials for bolting and flange materials with associated pressure/temperature ratings.

#### 4504: Section 3.2: 1989 Cast iron flanges

Flanges in grey, malleable and ductile cast iron from PN 2.5 to PN 40 and in sizes up to DN 4000. Facings, dimensions, tolerances, threading, bolt sizes, marking and materials for bolting and flange materials with associated pressure/temperature ratings.

#### 4504: Section 3.3: 1989 Copper alloy and composite flanges

Types of flanges from PN 6 to PN 40 and in sizes up to DN 1800. Facings, dimensions, tolerances, bolt sizes, marking and materials for bolting and flange materials with associated pressure/temperature ratings.

#### 4508: -- Thermally insulated underground pipe lines

#### 4508: Part 1: 1986 Steel-cased systems with air gap

Requirements of design, materials, construction, installation, testing and fault monitoring for steel-cased systems for temperatures exceeding 50°C.

#### 4508: Part 4: 1977 Specific testing and inspection requirements for cased systems without air gap

Testing, inspection and certification of pipe-in-pipe distribution systems with an insulated service or product pipe enclosed in a pressure tight casing.

#### 4543: -- Factory-made insulated chimneys

#### 4543: Part 1: 1990 Methods of test

Methods of test for circular cross sectional metal chimneys supplied in component form needing no site fabrication. Intended for internal 1196

#### 4543: Part 2: 1990 Chimneys with flue linings for use with solid fuel fixed appliances

Circular cross sectional chimneys needing no site fabrication for internal use

#### 4543: part 3: 1990 Chimneys with stainless steel flue lining for use with oil fired appliances

Requirements for chimneys with stainless steel internal and metal external surfaces intended for use with oil fired appliances.

#### 4814: 1990 Expansion vessels using an internal diaphragm for sealed hot water heating system

Requirements for manufacture and testing of carbon steel vessels up to 1000 L: capacity, up to 1000 mm diameter and for use in systems operating up to 6 bar.

#### Methods for testing and rating fan coil units, unit heaters and unit coolers

#### 4856: Part 1: 1972 (1983) Thermal and volumetric performance for heating duties, without additional ductwork

Methods of carrying out thermal and volumetric tests on forced convection units containing fluid to air heat exchangers and incorporating their own fans. The units are for heating applications and the tests are to be carried out on units in essentially clean conditions.

#### 4856: Part 2: 1975 (1983) Thermal and volumetric performance for cooling duties, without additional ductwork

Coolers as used for cooling and dehumidifying under frost-free conditions, the medium used being water or other heat transfer fluid (excluding volatile refrigerants).

#### 4856: Part 3: 1975 (1983) Thermal and volumetric performance for heating and cooling duties, with additional ductwork

Units for use with additional ducting containing fluid to air heat exchangers and incorporating their own electrically-powered fan system. For heating and cooling application, the latter with or without dehumidification under frost-free conditions.

4856: Part 4: 1997 Determination of sound power levels for fan coil units, unit heaters and unit coolers using reverberating rooms

#### 4857: -- Methods for testing and rating terminal reheat units for air distribution systems

## 4857: Part 1: 1972 (1983) Thermal and aerodynamic perfor-

Terminal reheat units with or without flow rate controllers.

#### 4857: Part 2: 1978 (1985) Acoustic testing and rating

Methods of testing and rating for static terminal attenuation, sound generation, upstream and downstream of the unit, radiation of sound from the casing.

#### 4876: 1984 Performance requirements for domestic flued oil burning appliances

Performance requirements and methods of testing for flued oil burning appliances (e.g. boilers and air heaters) up to and including 44 kW capacity, used for hot water supply and space heating.

#### 4954: -- Methods for testing and rating induction units for air distribution systems

#### 4954: Part 1: 1973 (1987) Thermal and aerodynamic performance

Methods of test for induction units with water coils for heating and/ or sensible cooling duties.

#### 4954: Part 2: 1978 (1987) Acoustic testing and rating

Methods of acoustic testing and rating of induction units for sound power emission and terminal attenuation.

#### 4979: 1986 Methods for aerodynamic testing of constant and variable dual or single duct boxes, single duct units and induction boxes for air distribution systems

Methods of test for casing leakage, valve and damper leakage, flow rate control, temperature mixing, induction flow rate and pressure requirements.

#### 5041: -- Fire hydrant systems equipment

#### 5041: Part 1: 1987 Landing valves for wet risers

Material, design and performance requirements for copper alloy globe and diaphragm valves for wet rising mains. Covers high and low pressure types.

#### 5041: Part 2: 1987 Landing valves for dry risers

Material and design requirements for copper alloy gate valves for dry rising mains.

5041: Part 3: 1975 (1987) Inlet breechings for dry riser inlets Requirements for 2 and 4-way inlet breechings on a dry rising water main for fire fighters.

#### 5041: Part 4: 1975 (1987) Boxes for landing valves

Dimensions to provide clearances and ensure that valves are easily accessible. Constructional details, requirements for hingeing, glazing, marking, locking of doors.

#### 5041: Part 5: 1974 (1987) Boxes for foam inlets and dry riser inlets

Standard sizes according to the number of inlets for foam or to the size of the riser. Choice and thickness of material. Dimensions of glass in the door frame and marking thereon. May also be used for other purposes, e.g. fuel oil inlets and drencher systems.

#### 5114: 1975 (1981) Performance requirements for joints and compression fittings for use with polyethylene pipes

Resistance to hydraulic pressure, external pressure and pull-out of assembled joints and effect on water and opacity.

#### 5141: -- Air heating and cooling coils

#### 5141: Part 1: 1975 (1983) Method of testing for rating cooling coils

Duct-mounted cooling coil rating test with chilled water as the cooling medium within specified ranges of variables for inlet air and water temperatures and for water flow and air velocity.

#### 5141: Part 2: 1977 (1983) Method of testing for rating heating coils

Rating test for duct-mounted air heating coils with hot water or dry saturated steam as the heating medium.

#### 5258: -- Safety of domestic gas appliances

#### 5258: Part 1: 1986 Central heating boilers and circulators

Safety requirements and associated test methods for natural draught and fan-powered boilers of rated heat input up to 60 kW and for circulators of rated heat input not exceeding 8 kW for circulators.

#### 5258: Part 5: 1989 Gas fires

Safety requirements and associated test methods for open-flued radiant and radiant convector gas fires.

#### 5258: Part 7: 1977 Storage water heaters

Safety requirements and associated test methods for domestic appliances having an input rating not exceeding 20 kW.

#### 5258: Part 9: 1989 Combined appliances: fanned circulation ducted air heaters/circulators

Safety requirements and associated methods of test for heaters either combined with, or designed to be fitted with, circulators. For rated heat inputs not exceeding 60 kW and 8 kW for circulators.

#### 5258: Part 13: 1986 Convector heaters

Requirements and associated test methods for flued natural draught and fan-powered heaters of input rating not exceeding 25 kW.

#### 5410: -- Code of practice for oil firing

5410: Part 1: 1977 Installations up to 44 kW output for space heating and hot water supply

5410: Part 2: 1978 Installation of 44 kW and above output for space heating, hot water and steam supply

Deals with provision of oil-burning systems for boiler and warm air heater plants and associated oil tanks.

5422: 1990 Thermal insulating material on pipes, ductwork and equipment (in the temperature range  $-40^{\circ}$ C to  $+700^{\circ}$ C)

Insulation of surfaces of process plant, vessels, tanks, ducts, pipelines, boilers, ancillary plant. Domestic, commercial and industrial applications for heating fluids, steam and refrigeration and air conditioning.

5433: 1976 Underground stop valves for water services

Copper alloy screwdown stop valves, nominal sizes 1/2 to 2.

5440: -- Installation of flues and ventilation for gas appliances of rated input not exceeding 60 kW.

5440: Part 1: 1990 Installation of flues

Complete flue equipment from the appliance connection to the discharge to outside air.

5440: Part 2: 1989 Installation of ventilation for gas appliances

Air supply requirements for domestic and commercial gas appliances installed in rooms and other internal spaces and in purpose designed compartments.

5449: 1990 Forced circulation hot water central heating systems for domestic premises

General planning, design considerations, materials, appliances and components, installation and commissioning. Includes small bore and microbore systems, open and sealed systems.

5588: -- Fire precautions in the design and construction of buildings

5588: Part 9: 1989 Code of practice for ventilation and air conditioning duct work

Recommendations to limit the potential for the spread of fire and its by products.

5615: 1985 Insulating jackets for domestic hot water storage cylinders

Performance in respect of maximum permitted heat loss, materials, design and marking of jackets for cylinders to BS 699 and BS 1566.

5720: 1979 Code of practice for mechanical ventilation and air conditioning in buildings

General design, planning, installation, testing and maintenance of mechanical ventilating and air conditioning systems. Covers general

matters, fundamental requirements, design considerations, types and selection of equipment, installation, inspection, commissioning and testing, operation and maintenance, overseas projects.

#### 5864: 1989 Installation in domestic premises of gas-fired ducted-air heaters of rated input not exceeding 60 kW

Selection, installation, inspection and commissioning, Includes commentary and recommendations.

#### 5885: -- Automatic gas burners

#### 5885: Part 1: 1988 Burners with input rating 60 kW and above

Safety aspects for burners employing forced or mechanically-induced draught, packaged or non-packaged types. Covers single burners and dual fuel burners when operating only on gas.

#### 5885: Part 2: 1987 Packaged burners with input rating 7.5 kW up to 60 kW

Requirements for small packaged burners employing forced and induced draught. Covers single burners and dual fuel burners when operating only on gas.

#### 5978: -- Safety and performance of gas-fired hot water boilers (60 kW to 2 MW input)

#### 5978: Part 1: 1989 General requirements

Performance, safety and methods of test for burners operating at internal pressures up to 4.5 bar.

5978: Part 2: 1989 Additional requirements for boilers with atmospheric burners

5978: Part 3: 1989 Additional requirements for boilers with forced or induced draught burners

### 5990: 1989 Direct gas fired forced convection air heaters with rated inputs up to 2 MW for industrial and commercial space heating

Safety and performance requirements.

### 5991: 1989 Indirect gas fired forced convection air heaters with rated input up to 2 MW for industrial and commercial space

Safety and performance requirements and methods of test for permanently installed open flued space heating appliances for industrial and commercial applications.

#### 6144: 1990 Expansion vessels using an internal diaphragm for unvented hot water supply systems

Requirements for manufacture and testing of steel vessels for use in systems operating with maximum pressure up to 10 bar.

#### 6230: 1991 Installation of gas-fired forced convection air heaters for commercial and industrial space heating of rated input exceeding 60 kW

Requirements for the selection and installation of direct and indirect fired air heaters with or without ducting and with or without recirculation of heated air

#### 6283: -- Safety and control devices for use in hot water systems

#### 6283: Part 1: 1991 Expansion valves for pressures up to and including 10 bar

Design, construction and testing of expansion valves of the automatic reseating type, specifically intended for preventing overpressurisation due to expansion of water in storage water heaters of the unvented type.

#### 6283: Part 2: 1991 Temperature relief valves for pressures from 1 bar to 10 bar

Design, construction and testing of temperature relief valves of the automatic reseating type, specifically intended for use with and protection of storage water heaters of the unvented type.

#### 6283: Part 3: 1991 Combined temperature and pressure relief valves for pressures from 1 bar to 10 bar

Design, construction and testing of combined temperature and pressure relief valves of the automatic reseating type, specifically intended for use with and protection of storage water heaters of the unvented type.

#### 6283: Part 4: 1991 Drop tight pressure reducing valves of nominal sizes up to and including DN50 for pressures up to and including 12 bar

Design, construction and testing of drop tight pressure reducing valves, sometimes known as pressure limiting valves.

#### 6332: -- Thermal performance of domestic gas appliances

#### 6332: Part 1: 1988 Thermal performance of domestic heating boilers and circulators

Thermal efficiency and associated methods of test for boilers and circulators of rated heat input up to and including 60 kW and 8 kW respectively.

#### 6332: Part 4: 1983 Thermal performance of independent convector heaters

Requirements and associated methods of test for heaters operating under natural draught.

#### 6332: Part 6: 1990 Thermal performance of combined appliances: fanned circulation ducted air heater/circulator

Thermal efficiency requirements and associated methods of test for appliances of rated heat input not exceeding 60 kW with circulators not exceeding 8 kW.

#### 6583: 1985 Methods for volumetric testing for rating of fan sections in central station air-handling units

Definitions of test unit and test installations, methods of test, presentation of data, extrapolation of data for geometrically similar sections and for those which are geometrically similar except for the fans, guide to the rating of air-handling units.

#### 6644: 1991 Installation of gas fired hot water boilers of rated inputs between 60 kW and 2 MW

Requirements for the installation of single and groups of boilers, selection and siting, open vented and sealed systems, controls and safety, air supply and ventilation, flues and commissioning.

#### 6675: 1986 Servicing valves (copper alloy) for water services

Three patterns of servicing valves for isolation of water supplies to individual sanitary appliances so that those appliances can be maintained or serviced.

#### 6700: 1987 Design, installation, testing and maintenance of services supplying water for domestic use within buildings

System of pipes, fittings and connected appliances installed to supply any building with hot and cold water for general purposes.

#### 6759: -- Safety valves

#### 6759: Part 1: 1984 Safety valves for steam and hot water

Requirements for safety valves for boilers and associated pipework for steam pressures exceeding 1 bar and hot water boilers of rating 44 kW and above.

#### 6798: 1987 Installation of gas-fired hot water boilers, of rated input not exceeding 60 kW

Selection, installation, inspection and commissioning of gas-fired central heating installations for domestic or commercial premises by circulation of heated water.

#### 6880: -- Code of practice for low temperature hot water heating systems of output greater than 45 kW

#### 6880: Part 1: 1988 Fundamental design considerations

Requirements which need to be taken into account in the design of open vented or sealed systems.

#### 6880: Part 2: 1988 Selection of equipment

Types of low temperature hot water heating equipment in common use and the selection of such equipment.

# 6880: Part 3: 1988 Installation, commissioning and mainte-

Recommendations for installation, commissioning, operation and maintenance of open vented or sealed systems.

#### 6896: 1991 Installation of gas-fired overhead radiant heaters for industrial and commercial heating

Installation, inspection and commissioning of heaters for other than domestic premises.

7074: -- Application, selection and installation of expansion vessels and ancillary equipment for sealed water systems

7074: Part 1: 1989 Code of practice for domestic heating and hot water supply

7074: Part 2: 1989 Code of practice for low and medium temperature hot water heating systems

Vessels and systems for heating larger premises, commercial and industrial.

7074: Part 3: 1989 Code of practice for chilled and condenser systems

Vessels and systems for air conditioning of commercial and industrial premises.

7186: 1989 Non domestic gas fired overhead radiant tube heaters Safety and construction and associated methods of test.

7206: 1990 Unvented hot water storage units and packages

Requirements for units and packages heated directly or indirectly. Cylinders with capacities from 15 L to 500 L having minimum opening pressure of 1 bar and minimum operating pressure of 3 or 6 bar, fitted with safety devices to prevent water temperature from exceeding 100°C.

7291: -- Thermoplastic pipes and associated fittings for hot and cold water for domestic purposes and heating installations in buildings

7291: Part 1: 1990 General requirements

General requirements and application classes for pipes up to 67 mm in alternative metric sizes for plastics or copper. Performance requirements for associated fittings.

7291: Part 2: 1990 Polybutylene (PB) pipes and associated fittings

Pipes 10 mm to 53 mm outside diameter.

7291: Part 3: 1990 Crosslinked polyethylene (PE-X) pipes and associated fittings and solvent cement

Pipes 12 mm to 35 mm outside diameter. Includes cemented joints.

7291: Part 4: 1990 Chlorinated polyvinylchloride (PVC) pipes and associated fittings and solvent cement

Pipes 12 mm to 63 mm outside diameter. Includes cemented joints.

7350: 1990 Double regulating globe valves and flow measurement devices for heating and chilled water

Pressure and temperature rating, materials, performance requirements, testing, marking, installation and operating instructions.

7478: 1991 Guide to selection and use of thermostatic radiator valves

Guidance on selection, application and use of thermostatic radiator valves.

7491: -- Glass reinforced plastics cisterns for cold water storage

7491: Part 1: 1991 One piece cisterns of capacity up to 500 L

7491: Part 2: 1992 One piece cistern of nominal capacity from 600 L to 25 000 L

7491: Part 3: 1994 Sectional tanks

7556: 1992 Thermoplastic radiator valves. Specification for dimensions and details on connection

7593: 1992 Code of practice for treatment of water in domestic hot water central heating systems

Guidance for the preparation of wet central heating systems prior to use, and for application of inhibitors.

8313: 1989 Code of practice for accommodation of building services in ducts

Recommendation for design, construction, installation and maintenance.

#### **European Standards**

BS EN 215: -- Thermostatic radiator valves

BS EN 215-1: 1991 Requirements and test methods

Definitions, mechanical properties, operating characteristics and test methods.

BS EN 253: -- Preinsulated bonded pipe systems for underground hot water networks. Pipe assembly of steel service pipes, polyurethane thermal insulation and outer casing of high density polyethylene.

Requirements and test methods for straight lengths of prefabricated thermally insulated pipe-in-pipe assemblies.

BS EN 297: 1994 Gas fired central heating boilers fitted with atmospheric burners of nominal heat input not exceeding 70 kW

BS EN 303: -- Heating boilers. Heating boilers with forced draught burners

BS EN 303-1: 1992 Terminology, general requirements, testing and marking

BS EN 303-2: 1992 Special requirements for boilers with atomising oil burners

BS EN 304: 1992 Heating boilers, Test code for heating boilers for atomising oil burners

BS EN 378: -- Refrigerating systems and heat pumps. Safety and environmental requirements

BS EN 378-1: 1995 Basic requirements

BS EN 442: -- Radiators and convectors

BS EN 442-1: 1996 Technical specifications and requirements

BS EN 442-1: 1997 Test methods and rating

BS EN 442-3: 1997 Evaluation of conformity

BS EN 448: 1995 Preinsulated bonded pipe systems for underground hot water networks. Fittings assemblies of steel service pipes, polyurethane thermal insulation and outer casing of polyethylene

BS EN 488: 1995 Preinsulated bonded pipe systems for underground hot water networks. Steel valve assembly of steel service pipes, polyurethane thermal insulation and outer casing of polyethylene

BS EN 489: 1995 Preinsulated bonded pipe systems for underground hot water networks. Joint assembly for steel service pipes, polyurethane thermal insulation and outer casing of polyethylene

BS EN 525: 1998 Non domestic direct gas fired convection air heaters for space heating not exceeding a net heat input of 300 kW

BS EN 621: 1998 Non domestic gas fired forced convection air heaters for space heating not exceeding a net heat input of 300 kW, without a fan to assist transportation of combustion air and/or combustion products

BS EN 625: 1996 Gas fired central heating boilers. Specific requirements for the domestic hot water operation of combination boilers of nominal heat input not exceeding 70 kW

BS EN 677: 1998 Gas fired central heating boilers. Specific requirements for condensing boilers with a nominal heat input not exceeding  $70~\mathrm{kW}$ 

BS EN 778: 1998 Domestic gas fired forced convection air heaters for space heating not exceeding a net heat input of 70 kW, without a fan to assist transportation of combustion air and/or combustion products

BS EN 779: 1983 Particulate air filters for general ventilation. Requirements, testing, marking

BS EN 1020: 1998 Non domestic gas fired forced convection air heaters for space heating not exceeding a net heat input of 300 kW, incorporating a fan to assist transportation of combustion air and/or combustion products

BS EN 1057: 1996 Copper and copper alloys. Seamless round copper tubes for water and gas in sanitary and heating applications

BS EN 1196: 1998 Domestic and non-domestic gas fired air heaters. Supplementary requirements for condensing air heaters

BS EN 1254: -- Copper and copper alloys. Plumbing fittings

BS EN 1254-1: 1998 Fittings with ends for capillary soldering or capillary brazing to copper tubes

BS EN 1254-2: 1998 Fittings with compression ends for use with copper tubes

BS EN 1254-3: 1998 Fittings with compression ends for use with plastics pipes

BS EN 1254-4: 1998 Fittings combining other end connections with capillary or compression ends

BS EN 1254-5: 1998 Fittings with short ends for capillary brazing to copper tubes

BS EN 1264: -- Floor heating. Systems and components

BS EN 1264-1: 1998 Definitions and symbols

BS EN 1264-2: 1998 Determination of the thermal output

BS EN 1264-3: 1998 Dimensioning

BS EN 1886: 1998 Ventilation for buildings. Air handling units. Mechanical performance

#### International Standards

BS ISO 4065: 1996 Thermoplastics pipes. Universal wall thickness table

BS EN ISO 5167: -- Measurement of fluid flow by means of pressure differential devices

BS EN ISO 5167-1: 1997 Orifice plates, nozzles and Venturi tubes inserted in circular cross section tubes running full

BS ISO 6243: 1997 Climatic data for building design. Proposed systems of symbols

BS EN ISO 6708: 1996 Pipework components. Definition and selection of DN (nominal size)

BS EN ISO 6946: 1997 Building components and building elements. Thermal resistance and thermal transmittance. Calculation method

BS EN ISO 9251: 1996 Thermal insulation. Heat transfer. Conditions and properties of materials. Vocabulary

BS EN ISO 9288: 1996 Thermal insulation. Heat transfer by radiation. Physical quantities and definitions

BS EN ISO 9300: 1995 Measurement of gas flow by means of critical flow Venturi nozzles

BS EN ISO 10211: -- Thermal bridges in building construction. Heat flows and surface temperatures

BS EN ISO 10211-1: 1996 General calculation methods

BS ISO 11922: -- Thermoplastics pipes for the conveyance of fluids. Dimensions and tolerances

BS ISO 11922-1: 1997 Metric series

BS ISO 11922-2: 1997 Inch-based series

BS EN ISO 13370: 1998 Thermal performance of buildings. Heat transfer via the ground. Calculation methods

BS ISO TR 15377: 1998 Measurement of fluid flow by means of pressure differential devices. Guidelines for specification of nozzles and orifice plates beyond the scope of ISO 5167-1

Describes the geometry and methods of use of various types of orifice plates and nozzles outside the scope of ISO 5167-1.
